Sciences

Université de Paris

LE TUBE DIGESTIF EN ECHO

Professeur Etienne DANSE

Université Catholique de Louvain Cliniques Universitaires St Luc ,
1200 Bruxelles

Docteur Pascale PLAQUET CAMUS
CHU Amiens - Péronne

LE TUBE DIGESTIF EN ECHO

Cible : toute pathologie inflammatoire / ... »ite«

orientation clinique

- Douleurs abdominales
++FID , FIG

- Signes digestifs et
généraux

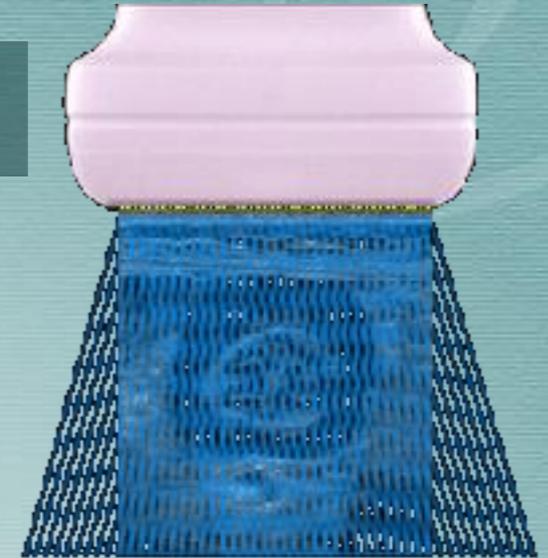

Découverte fortuite sur
examen global

1er choix :

Appendicite
Colites / MICI
diverticulite

Pédiatrie / IIA, SHP

LE TUBE DIGESTIF EN ECHO

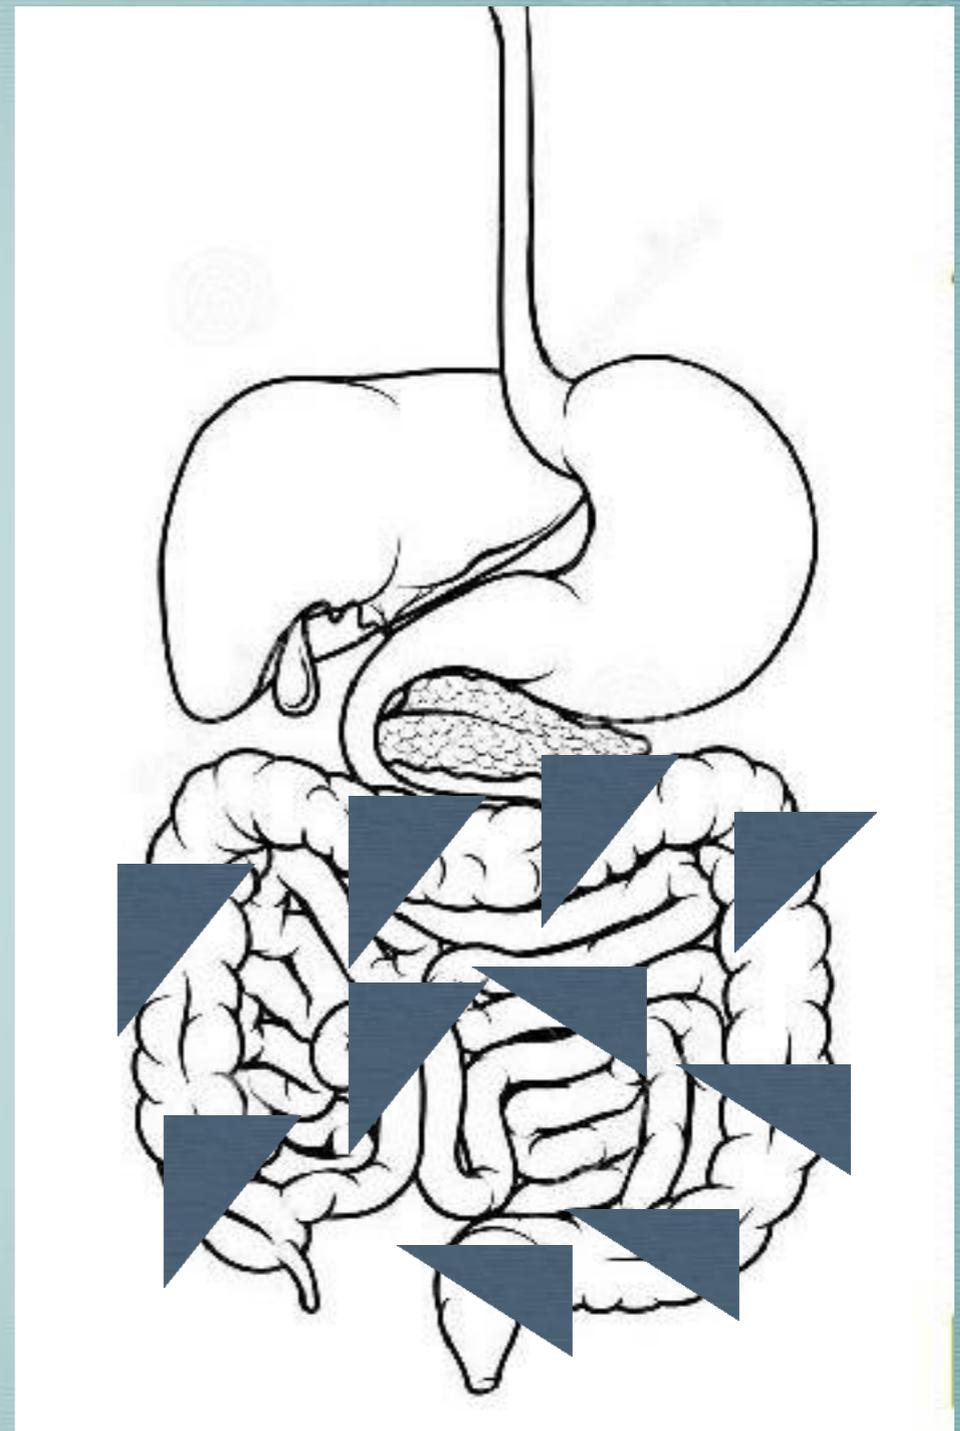

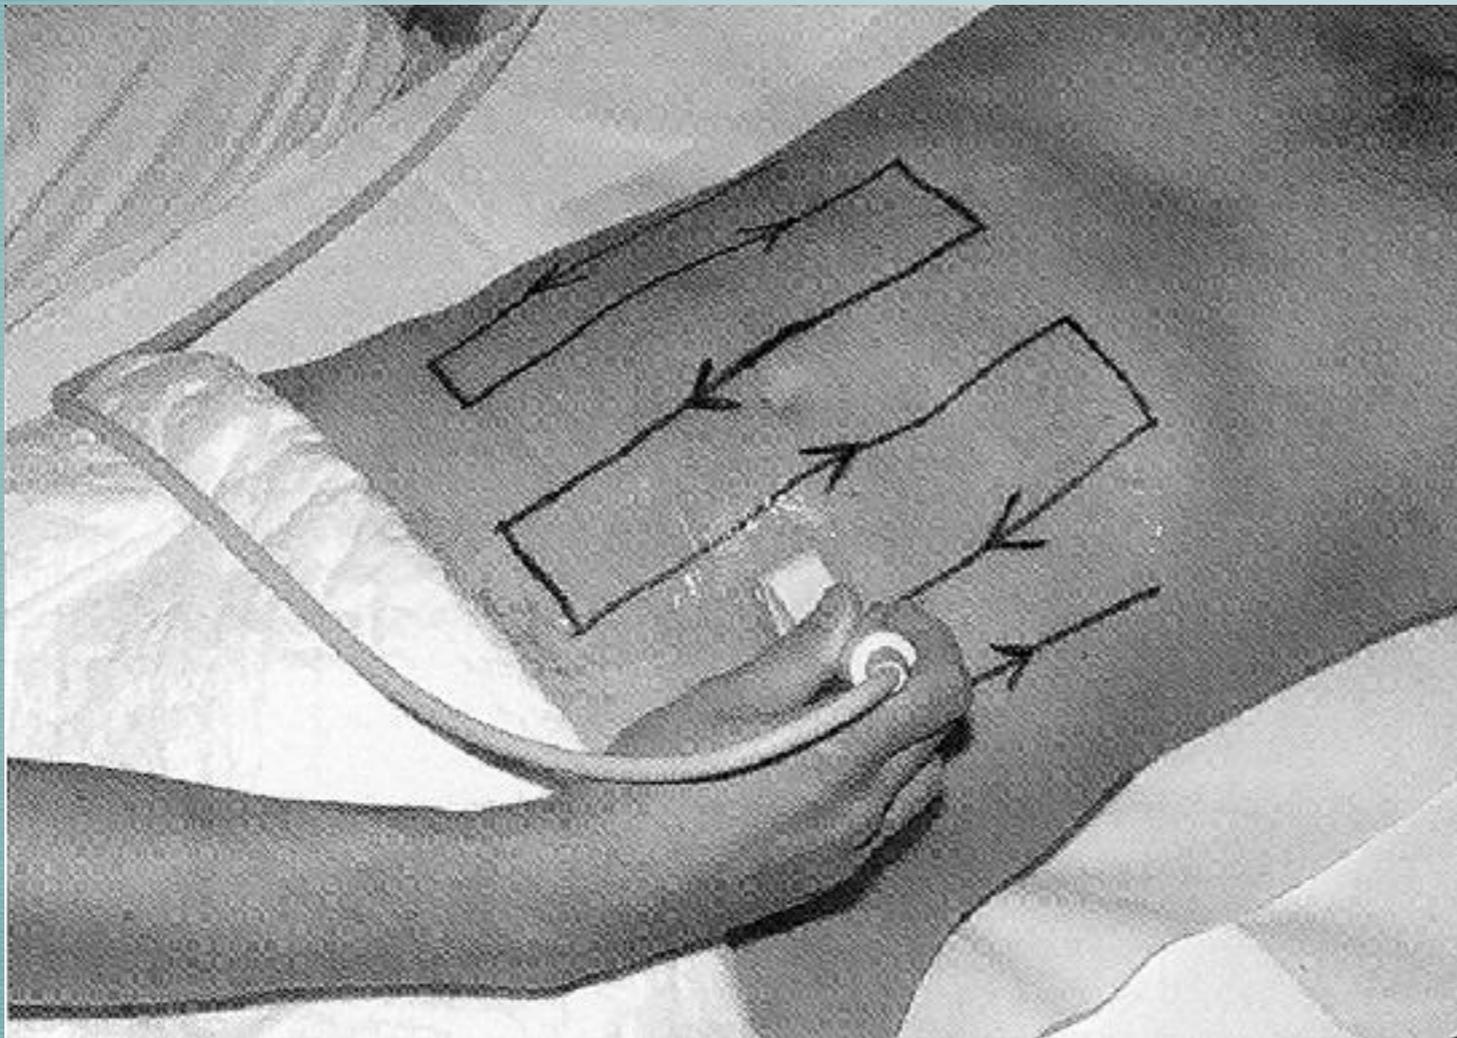

Après examen abdominal général
Examen ciblé/changement de sonde

⇒ Segments

Oesophage
Estomac
Grêle
Appendice
Colon

Technique

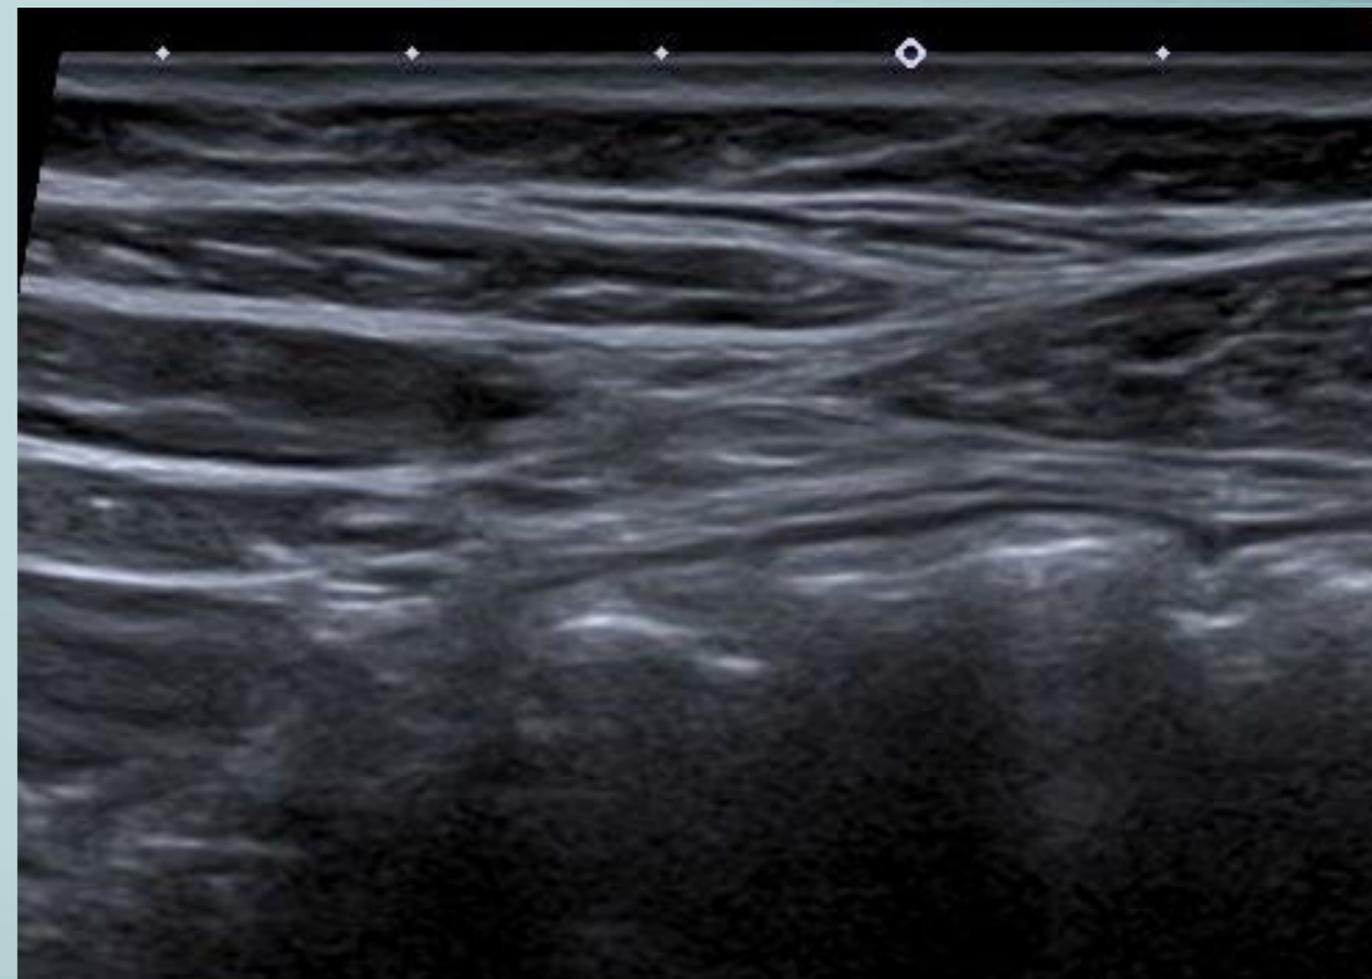

Sturm et al Eur Radiol, 2004

Réglages adaptés !.....

Analyse du tube digestif en US

Sonde de basse fréquence

Sonde de haute fréquence

Où est le tube digestif

REPERES ANATOMIQUES

épigastre : estomac / duodénum

HC droit : duodénum / colon dt

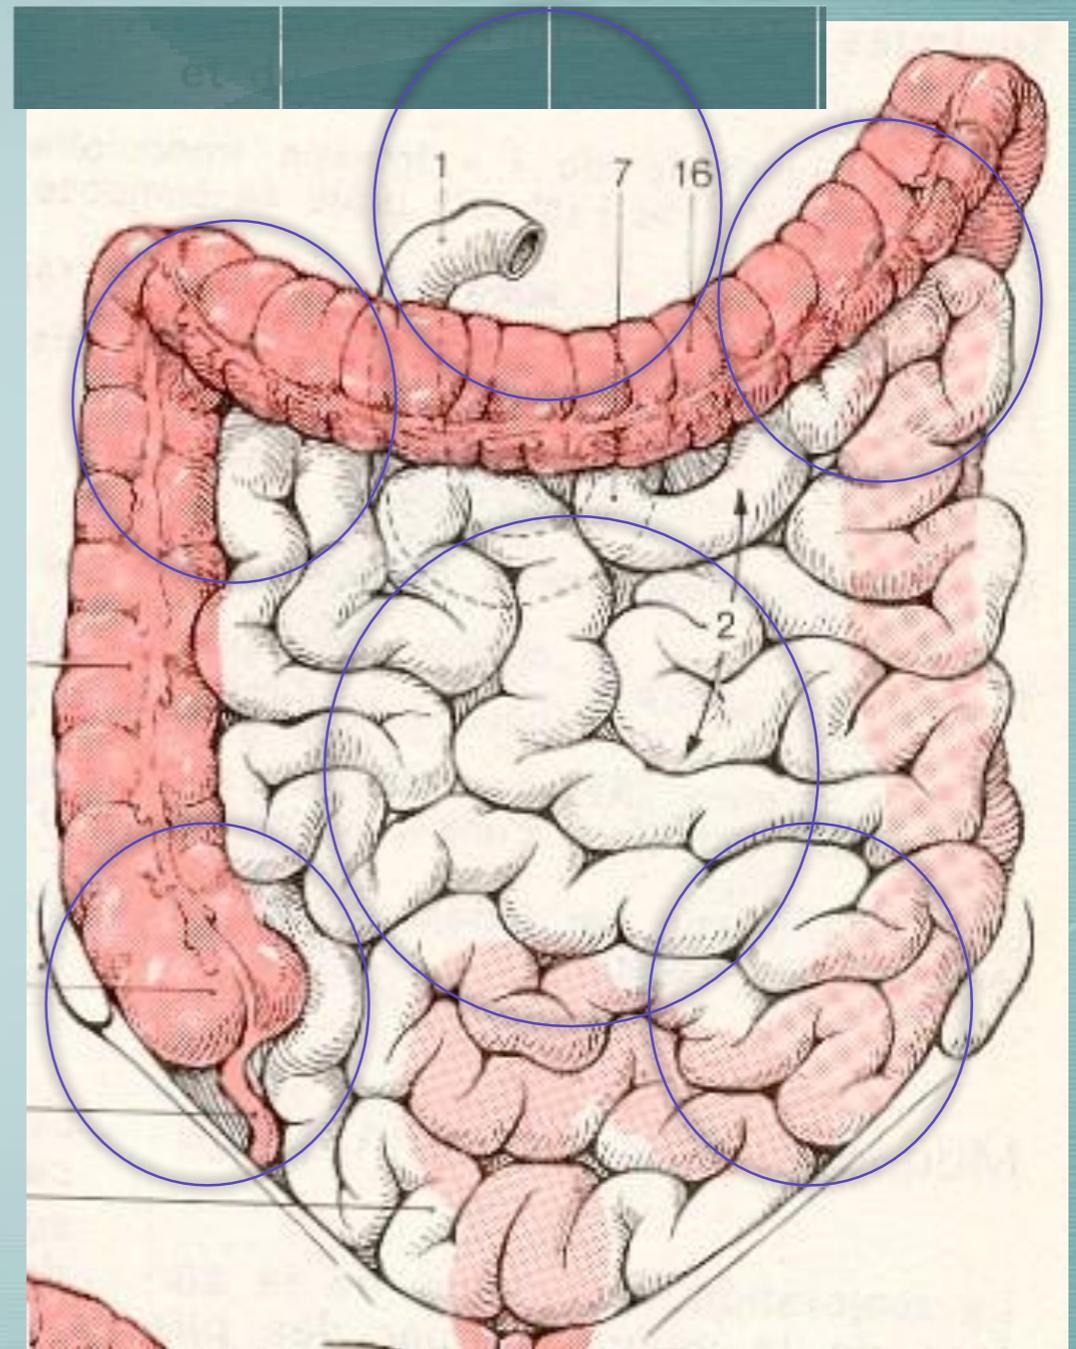

Flanc droit : colon

FID : caecum / appendice

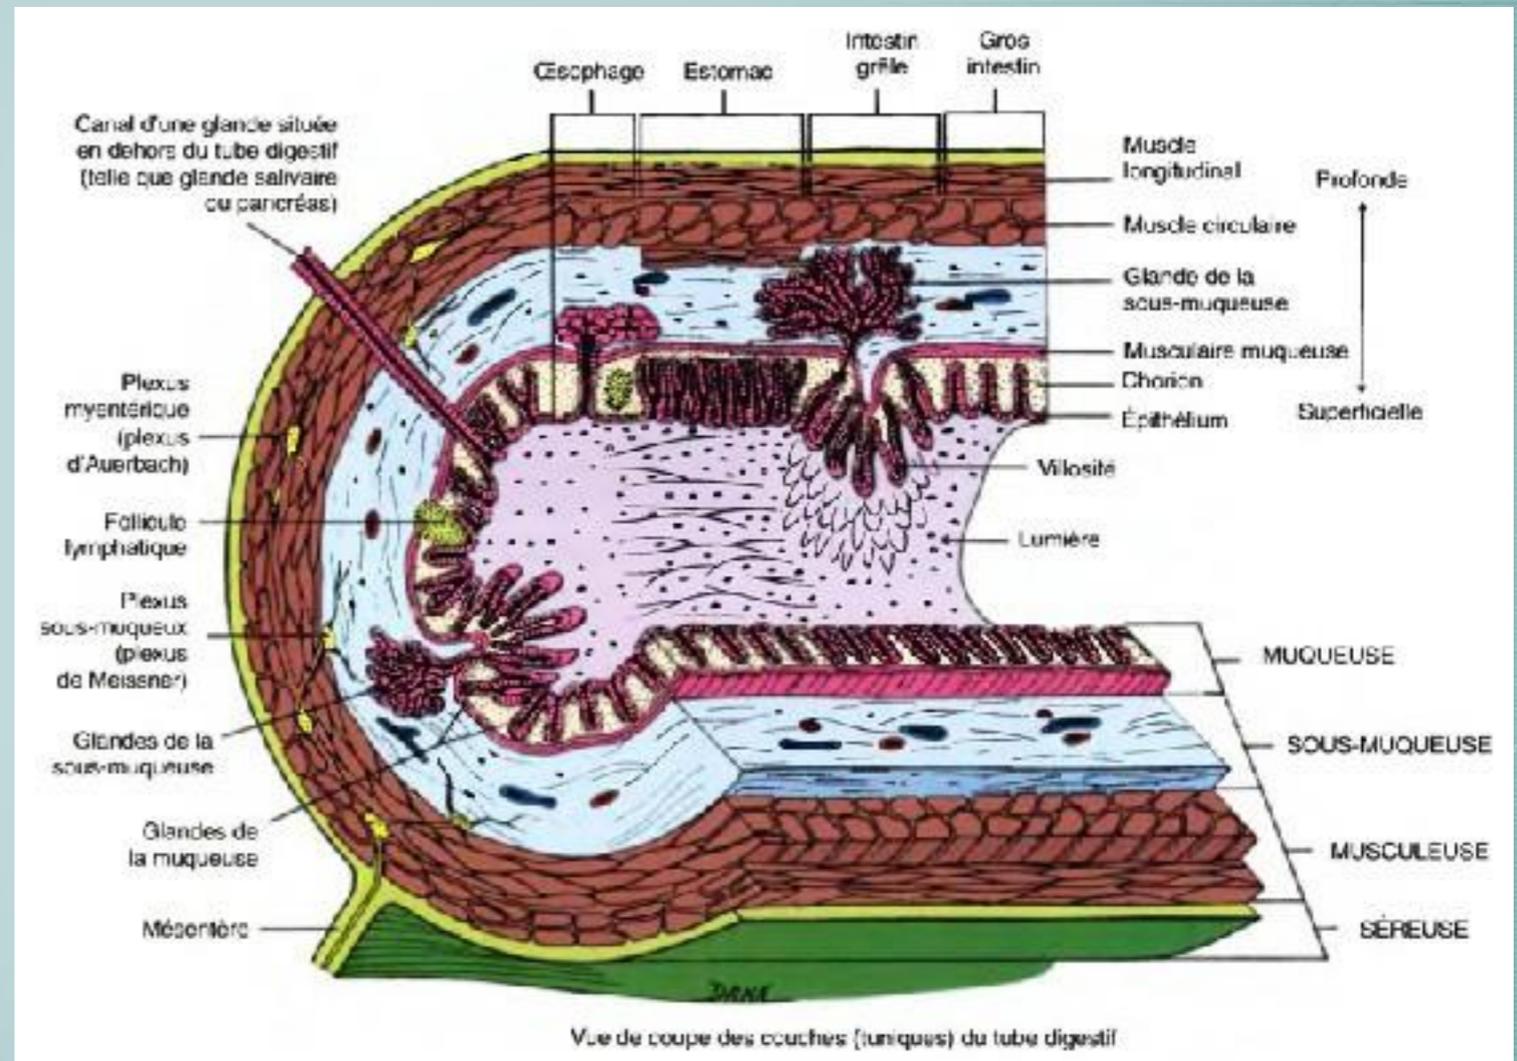

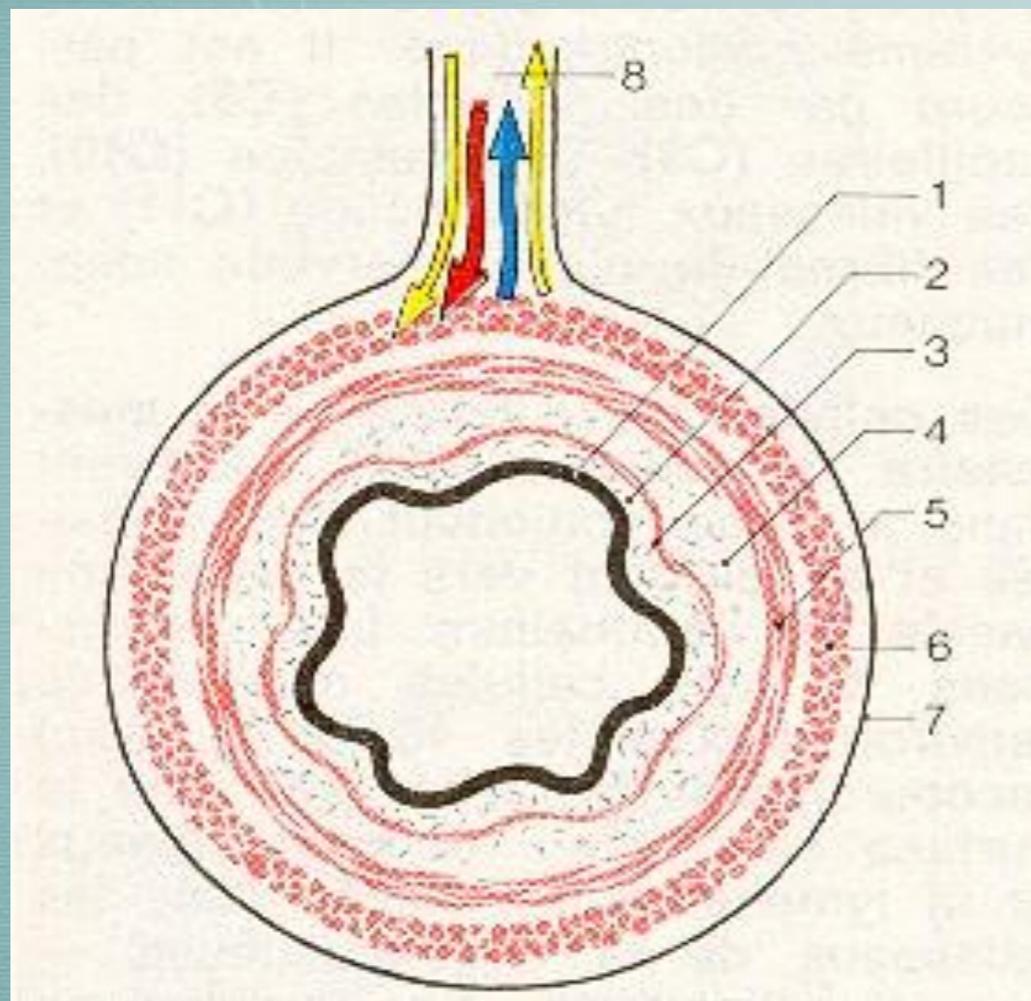

compartiment médian : grêle

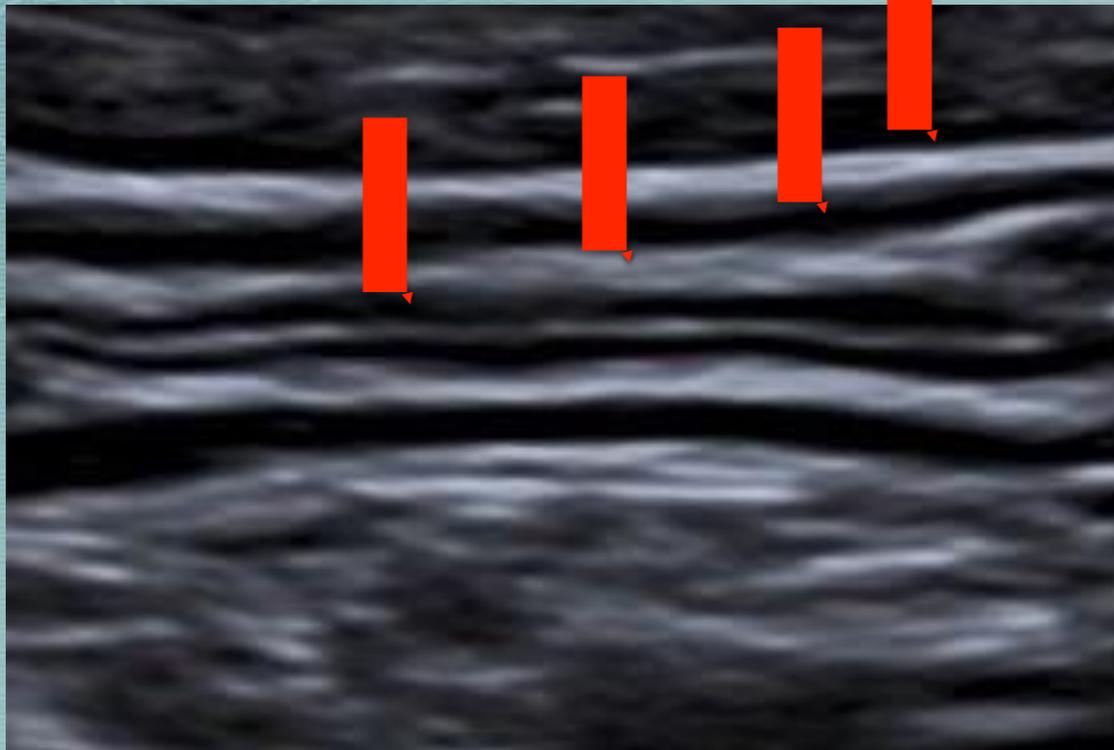

HC , flanc gauche : colon g

FIG : sigmoïde

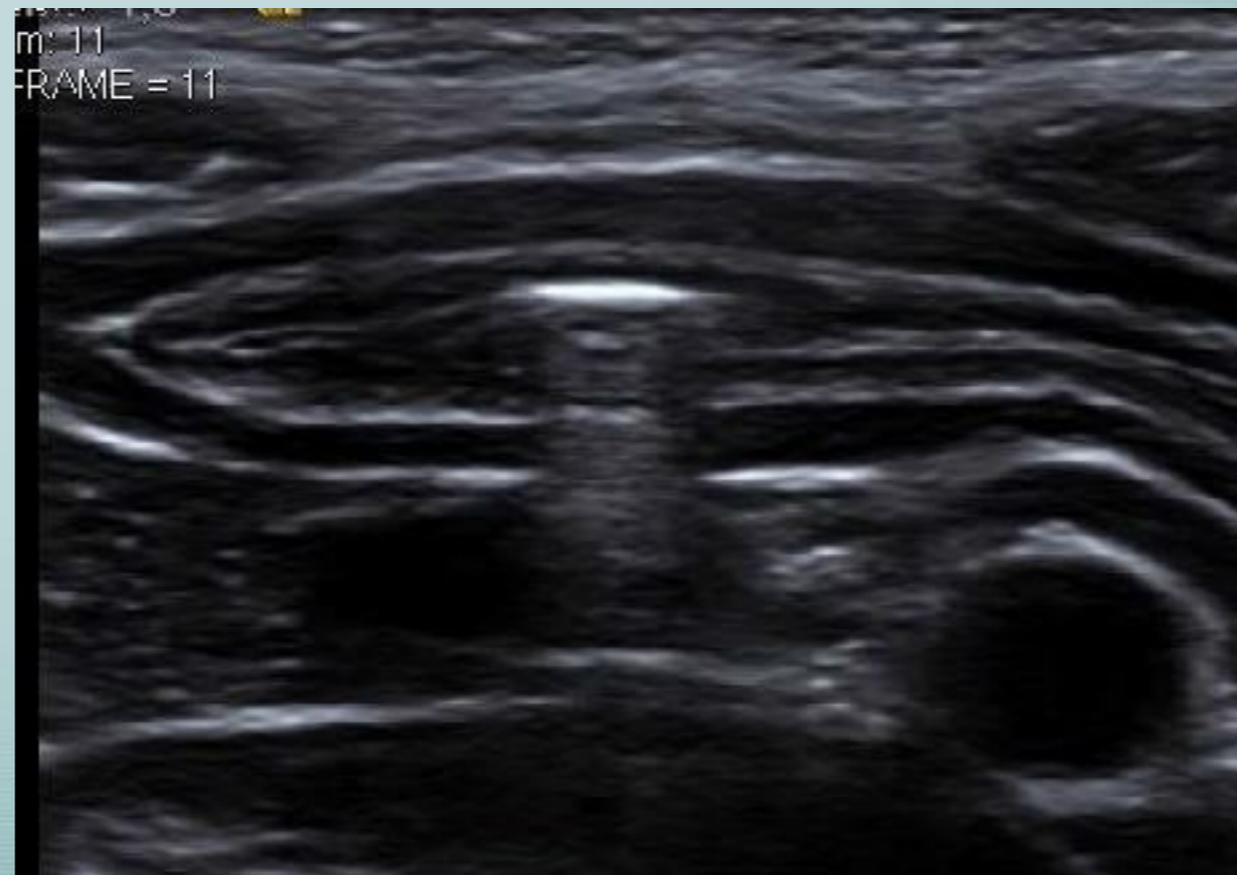

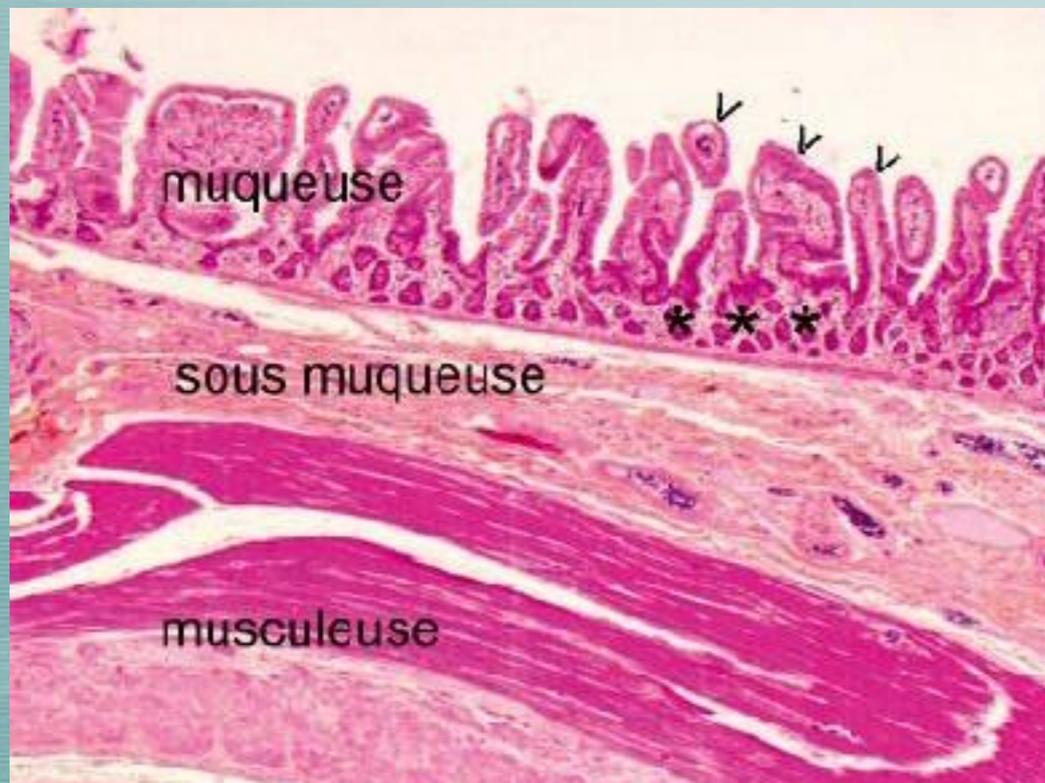

Aspect US normal du tube digestif : la signature digestive

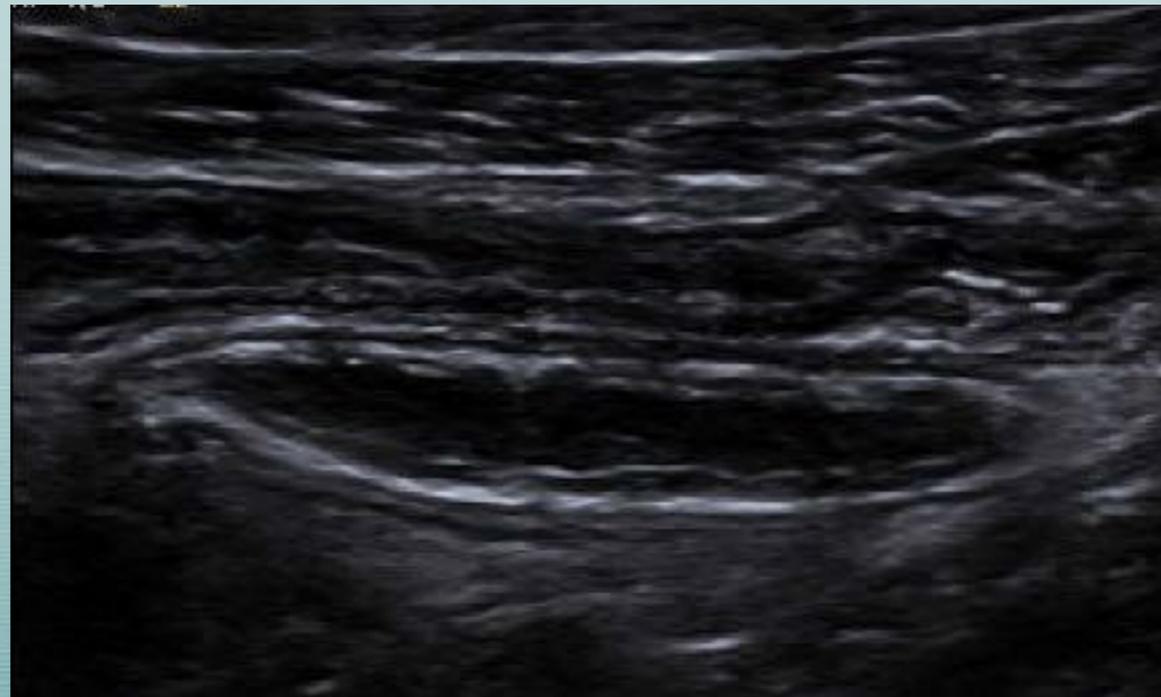

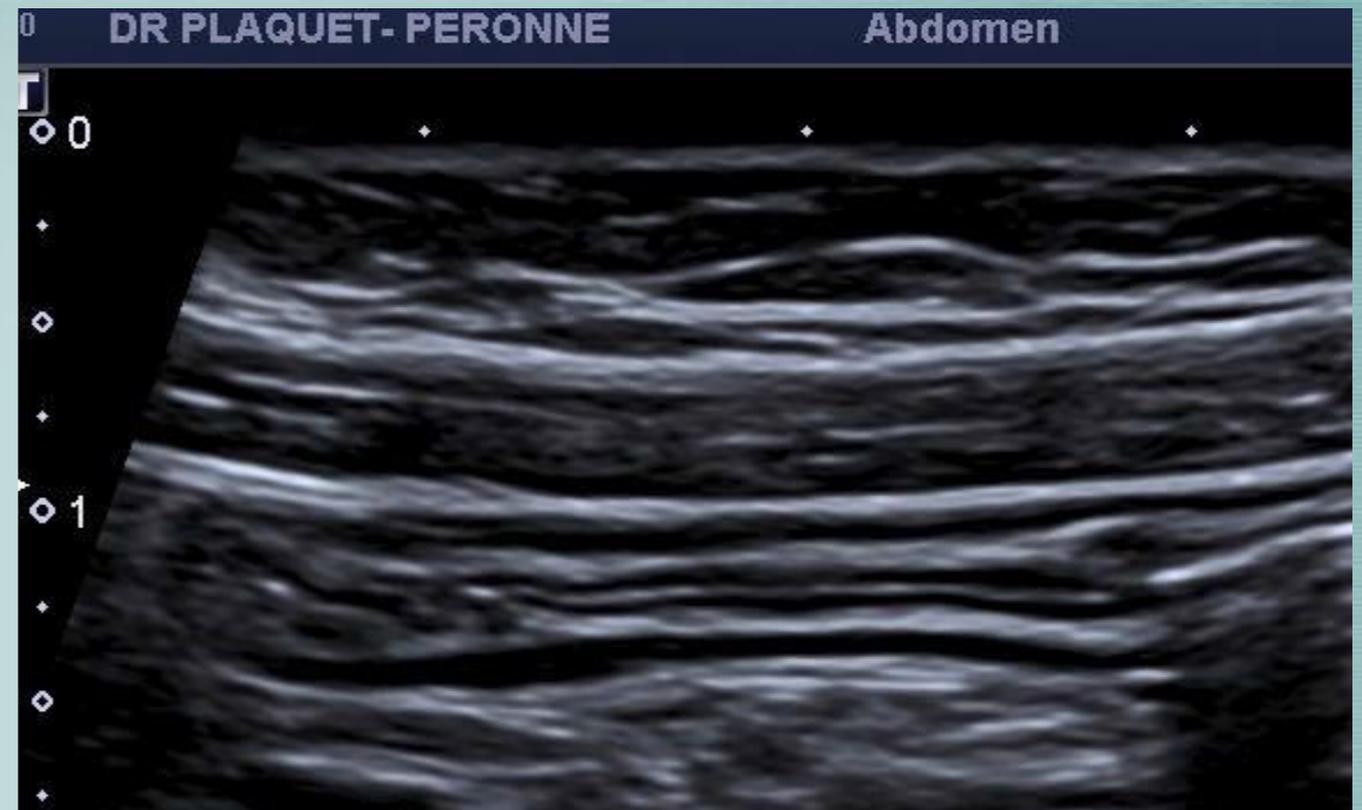

Paroi digestive normale

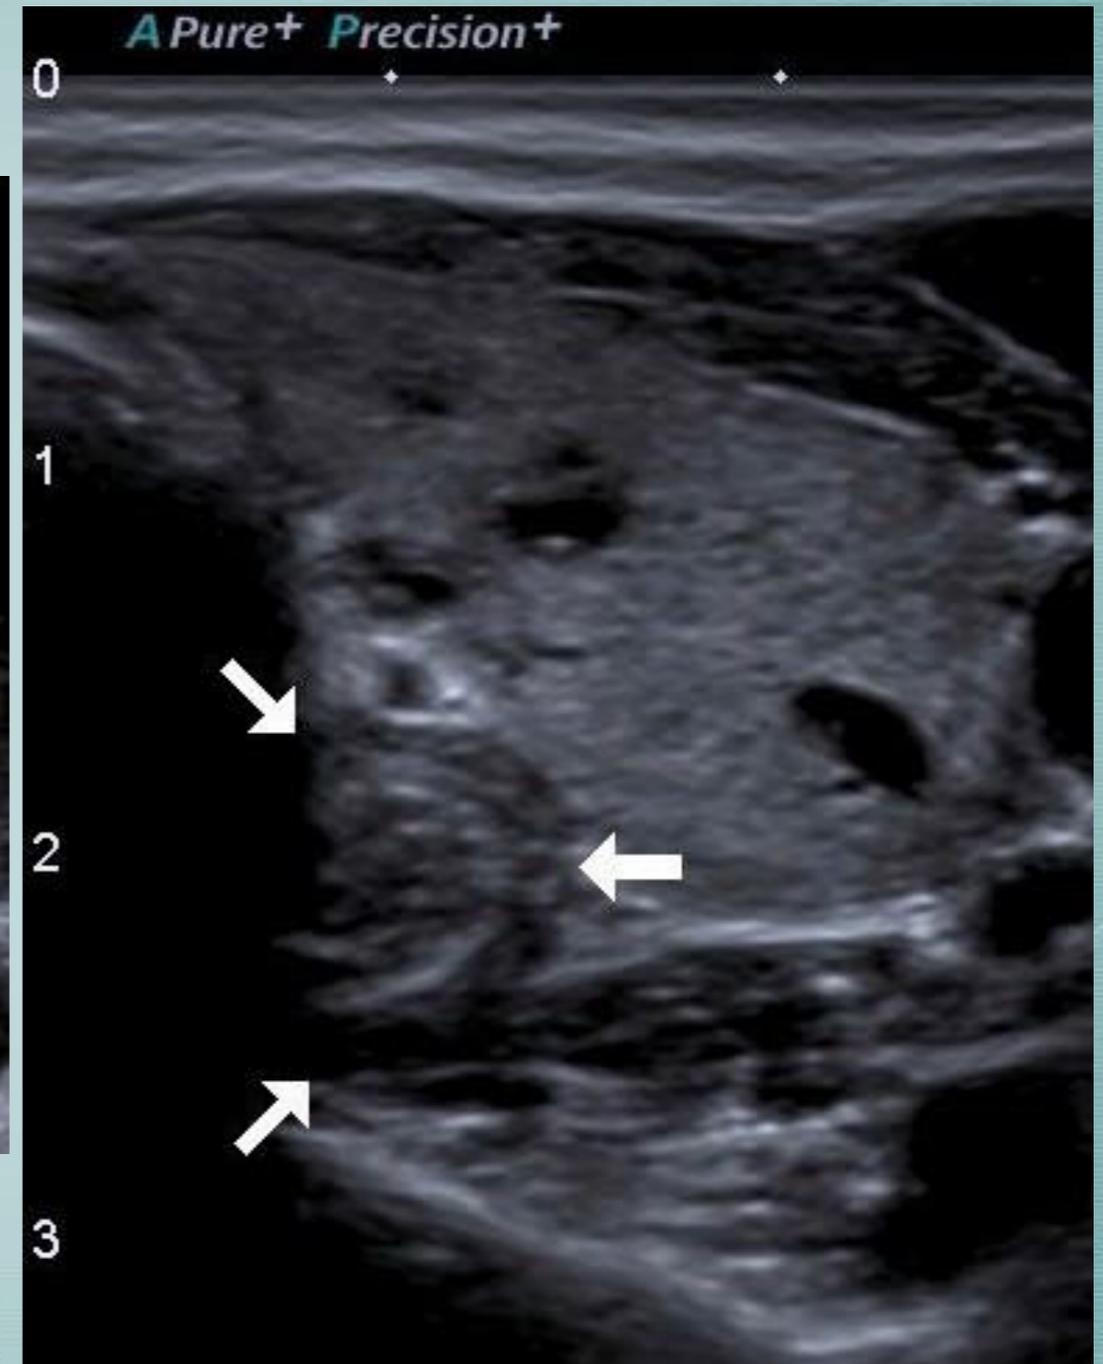

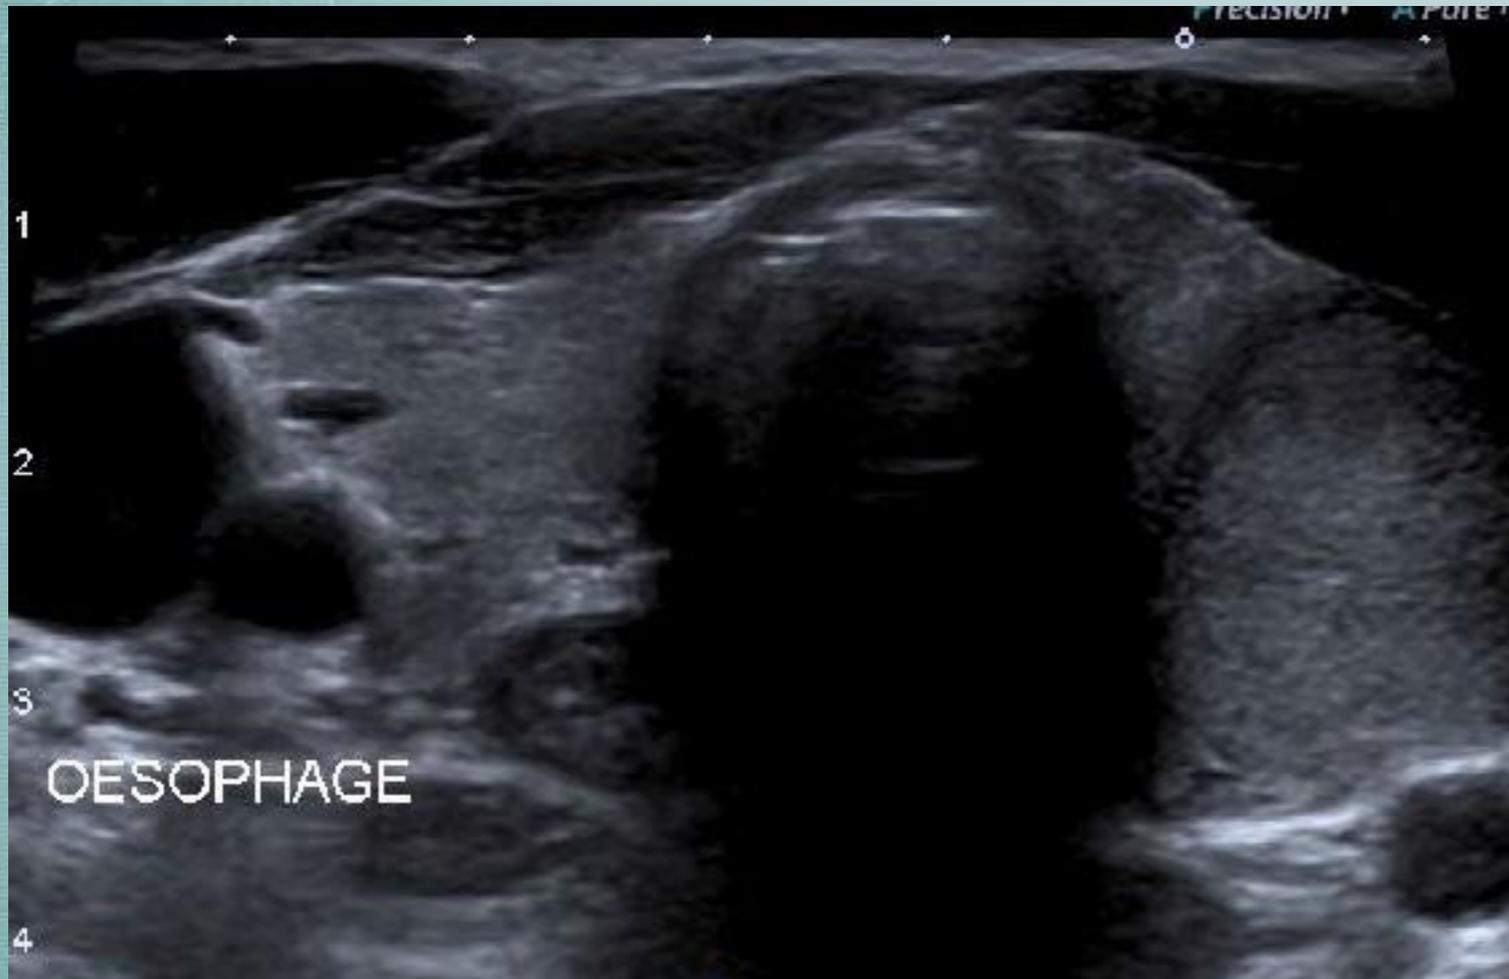

muqueuse : hypo
 ss muqueuse : hyper
 musculieuse : hypo
 fine séreuse: hyper

Vascularisation / Environnement

Qu'est ce qu'on cherche ?

Signes pathologiques :

un épaissement pariétal

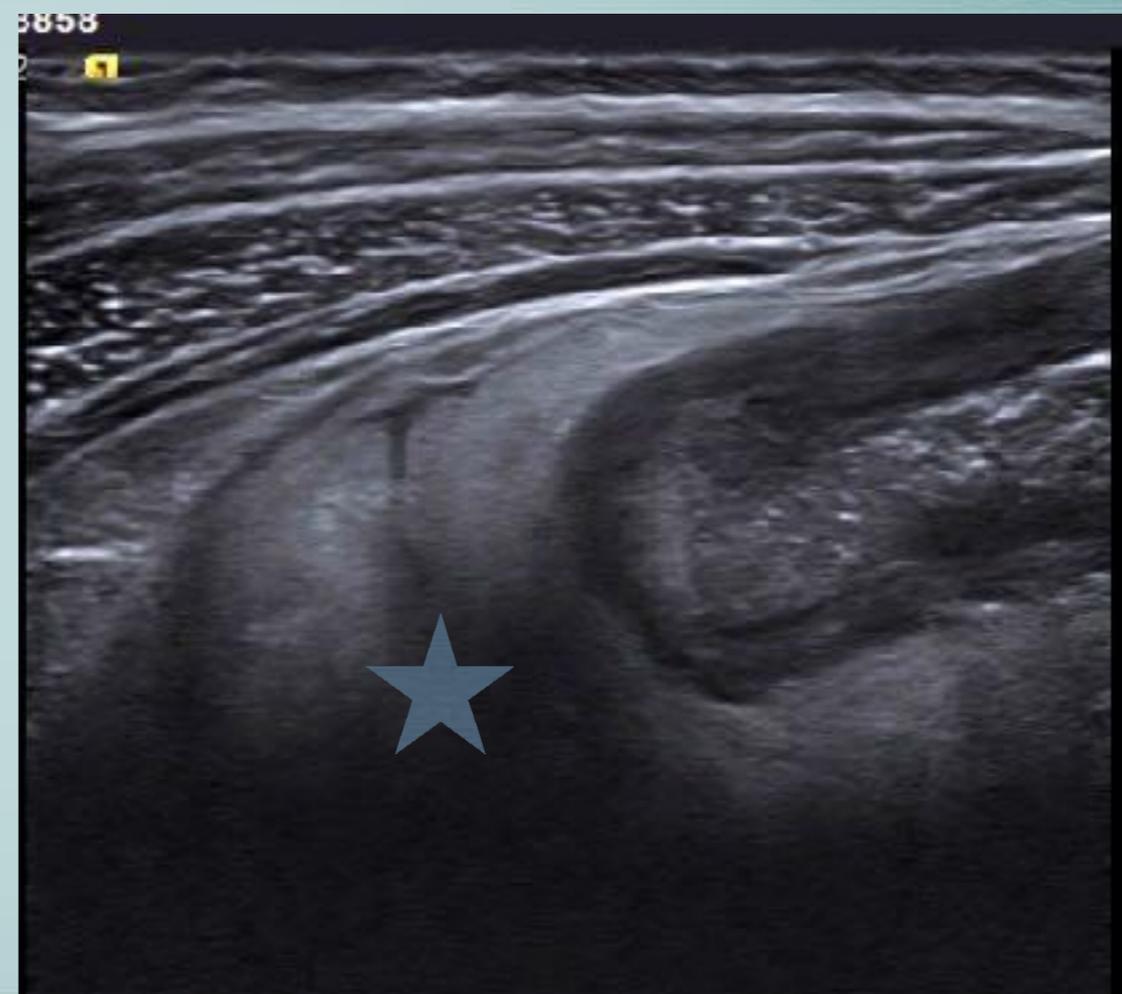

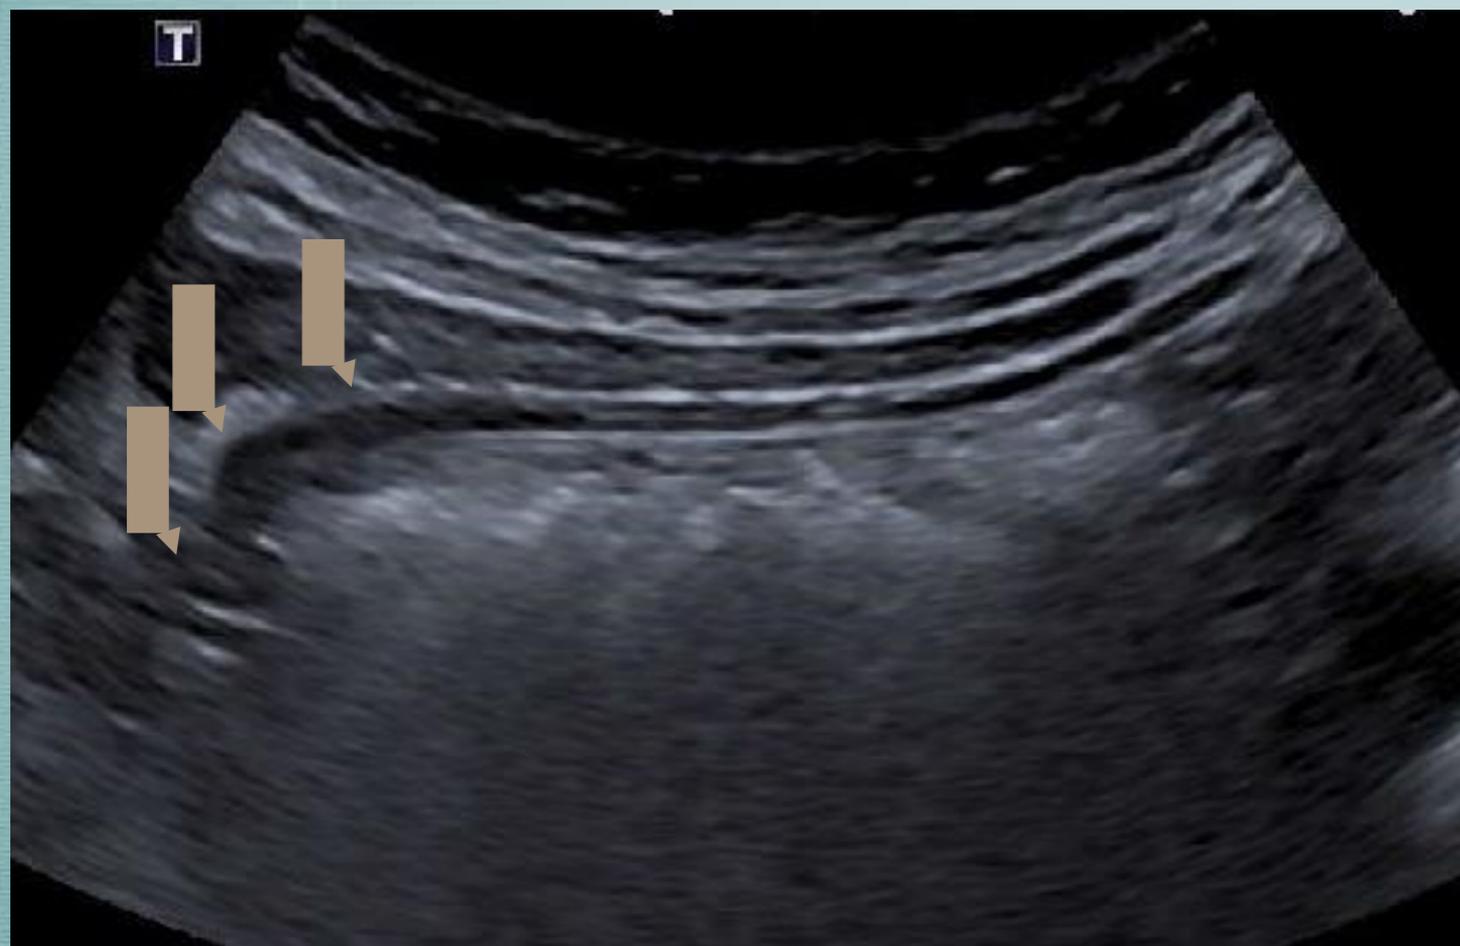

+/- une hyperhémie

une infiltration de la graisse satellite

un syndrome de masse

une dilatation

Environnement : la graisse péritonéale le fil d'Ariane +++

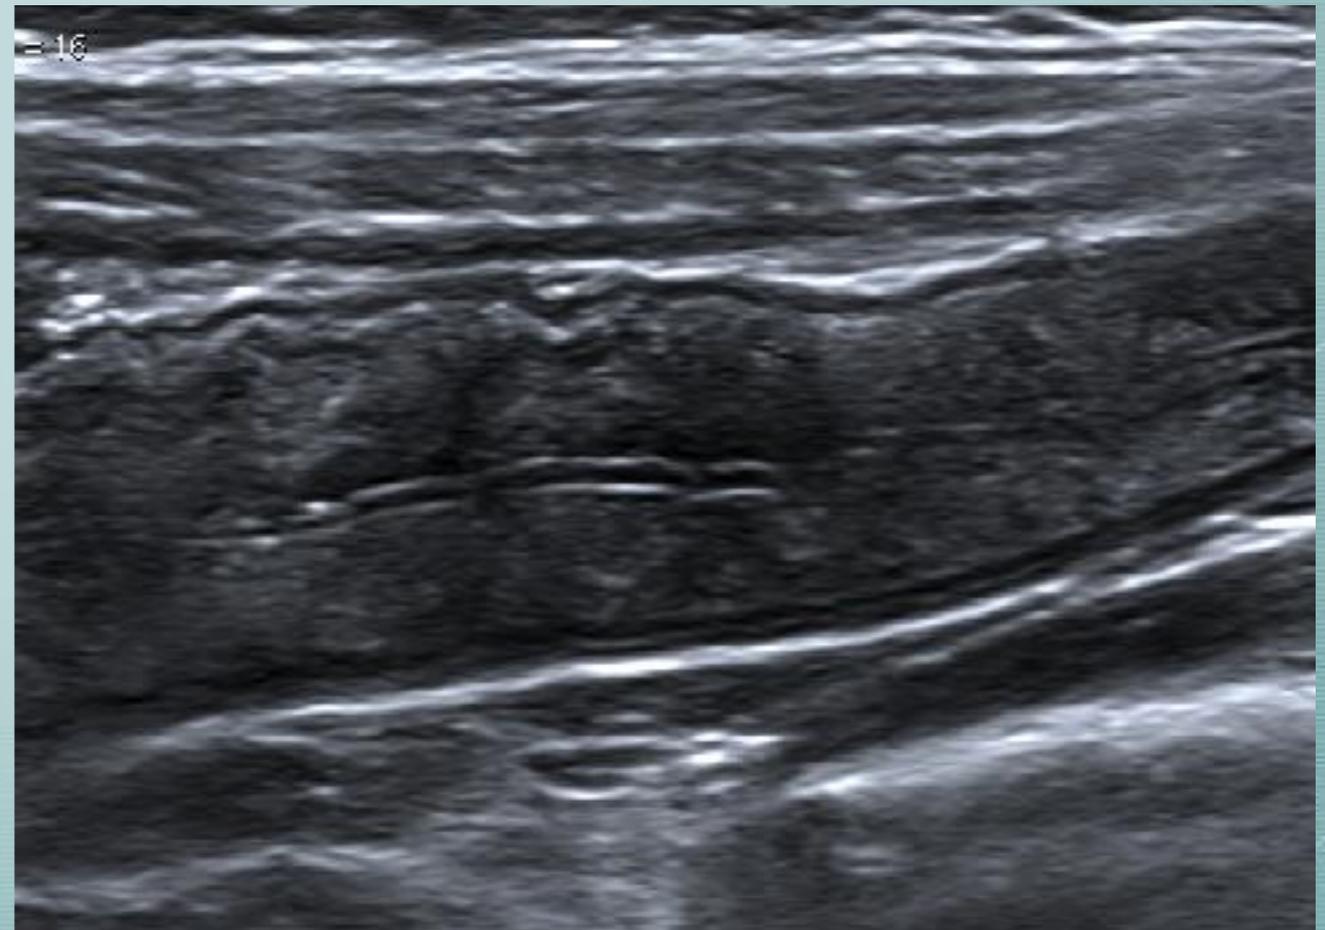

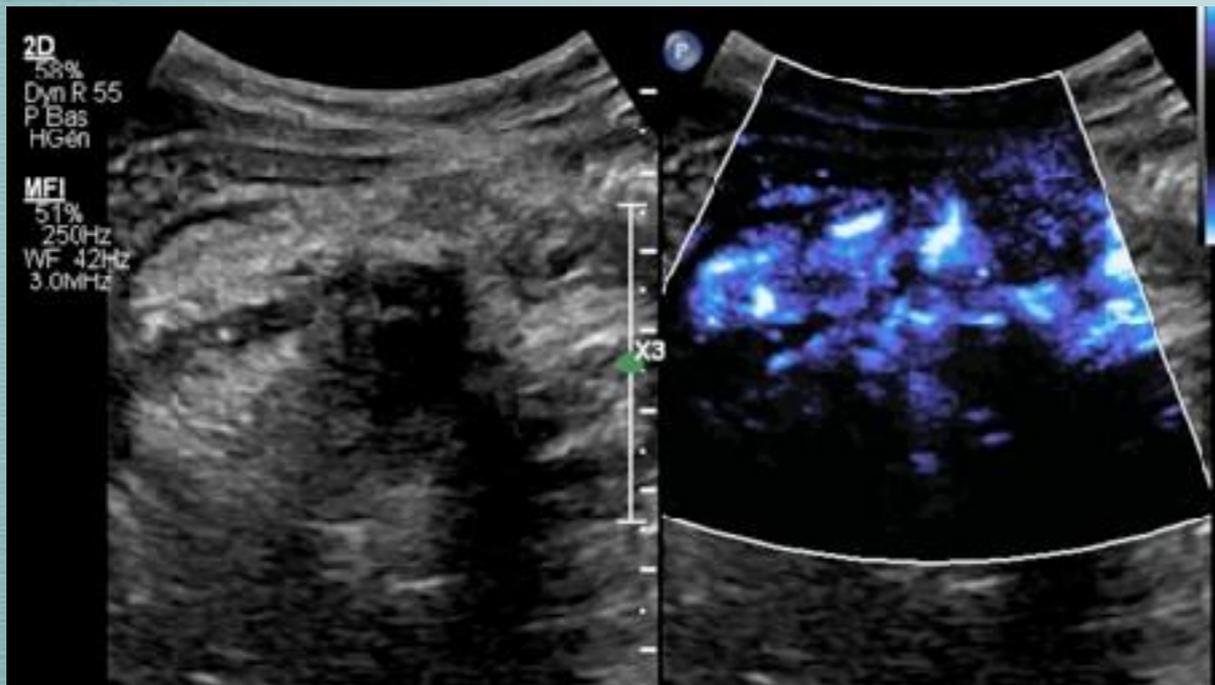

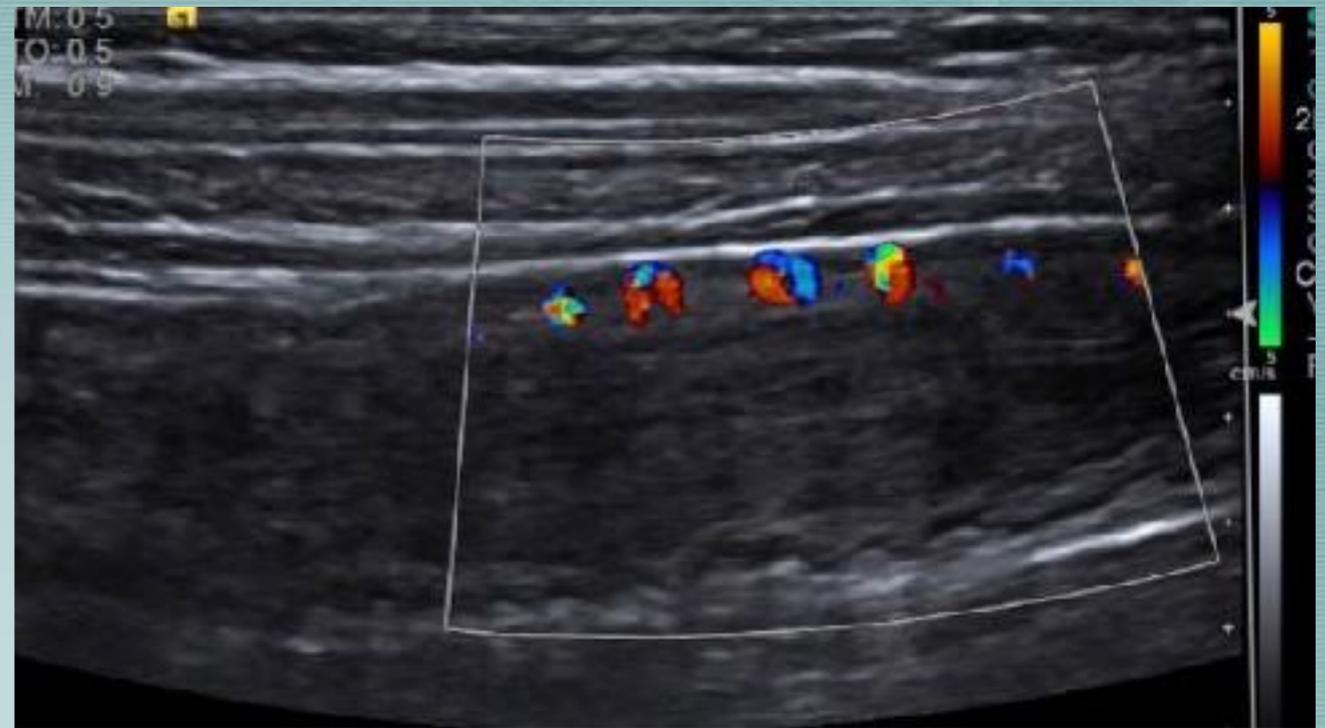

Signature inflammatoire

Iléite terminale Crohn

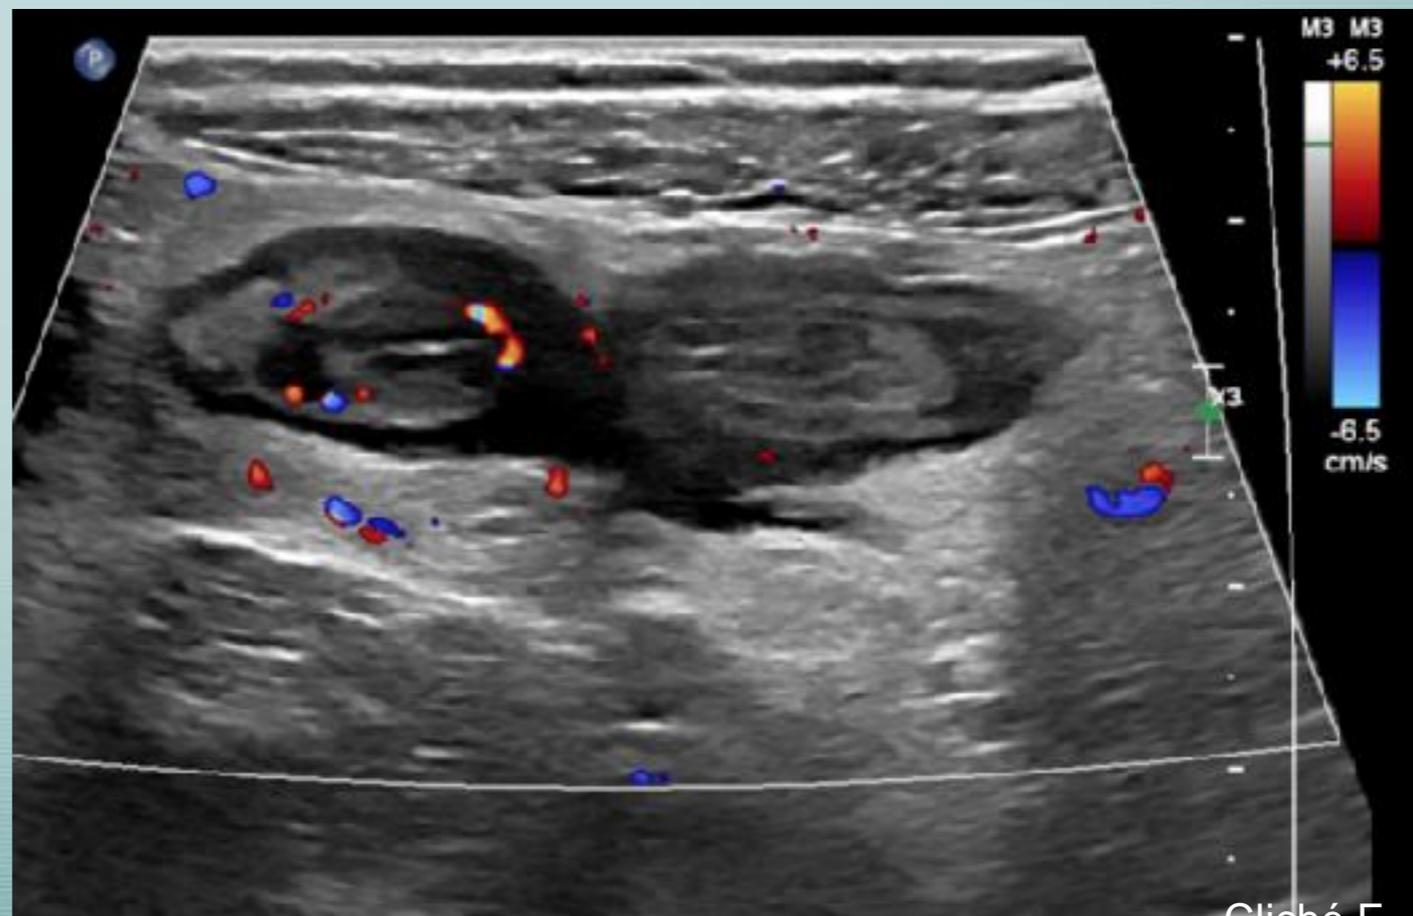

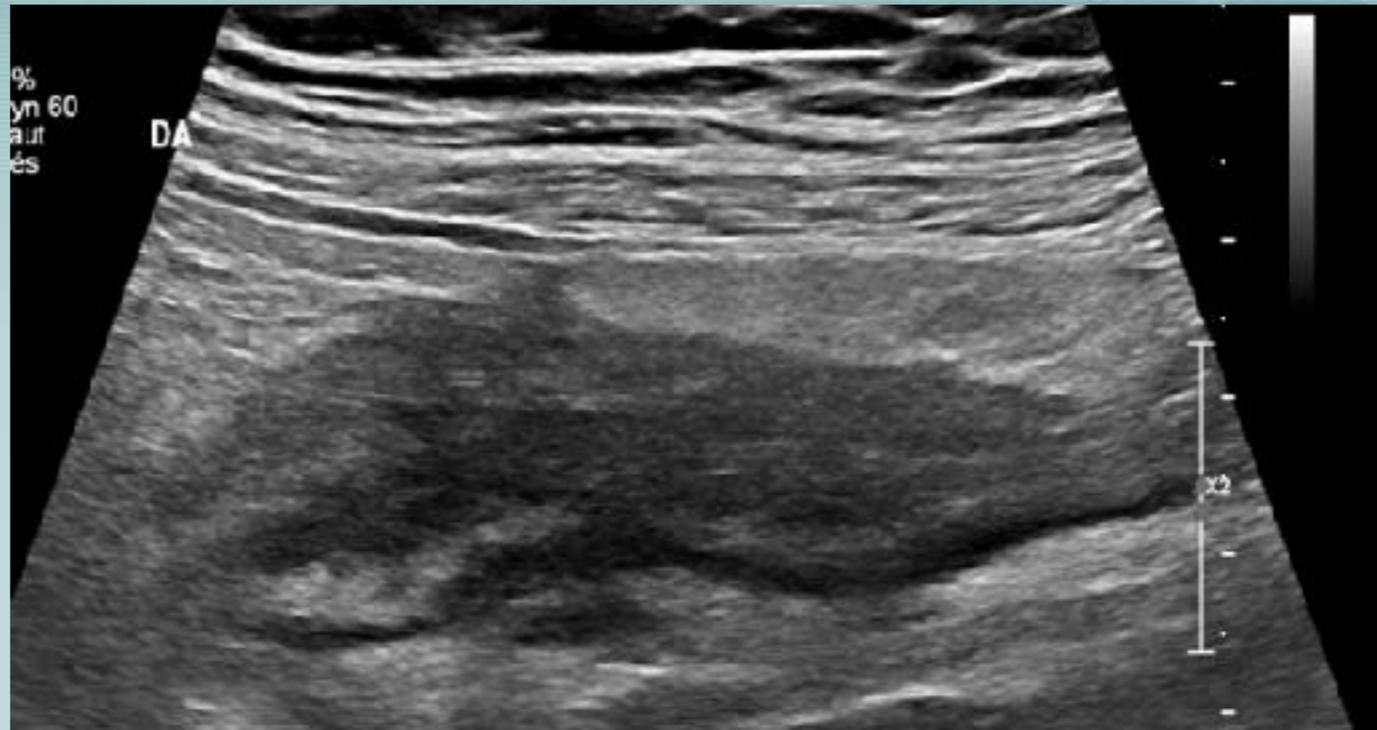

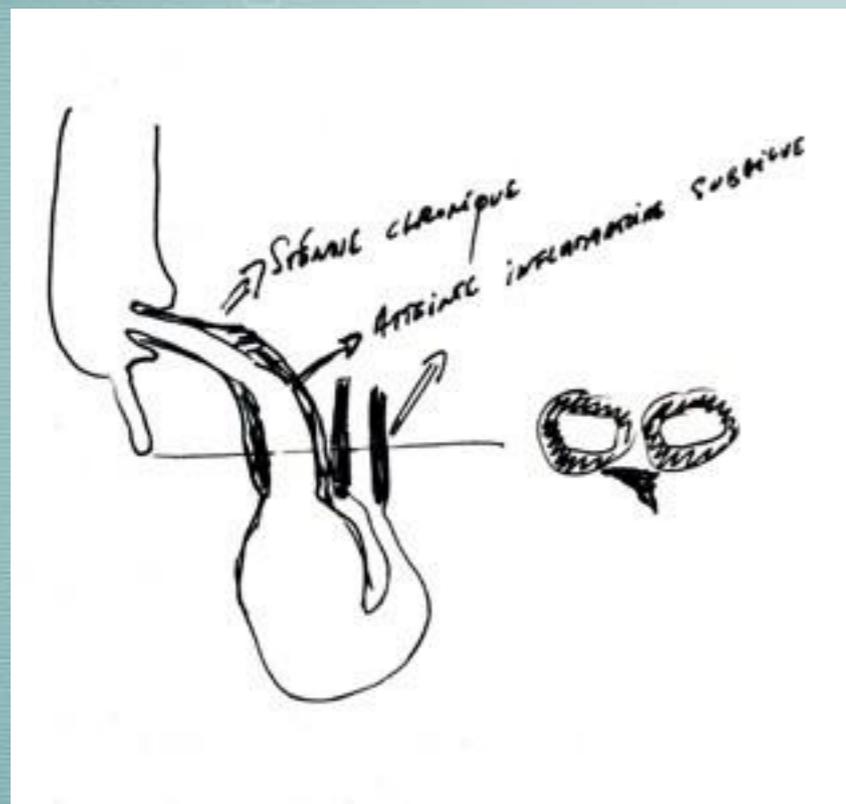

topographie Extension	couches atteintes	épaississement	stratification	Doppler couleur	signes associés
Iléon terminal +/- étendue Discontinue	sous muqueuse Transmurale	7 / 8 mm	Conservée si forme aigue dédiérenciation au stade chronique	++	GG , fistules , abcès

Iléite terminale Crohn

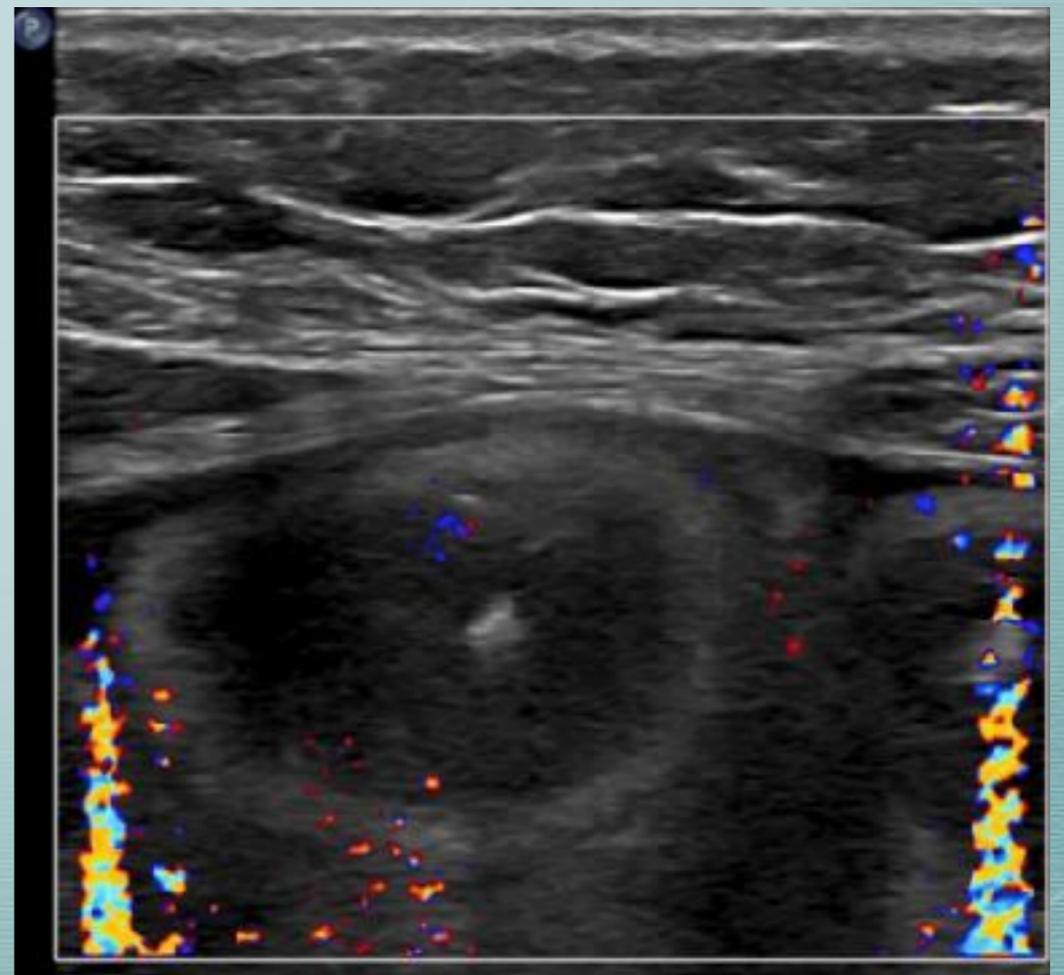

Iléite terminale Crohn

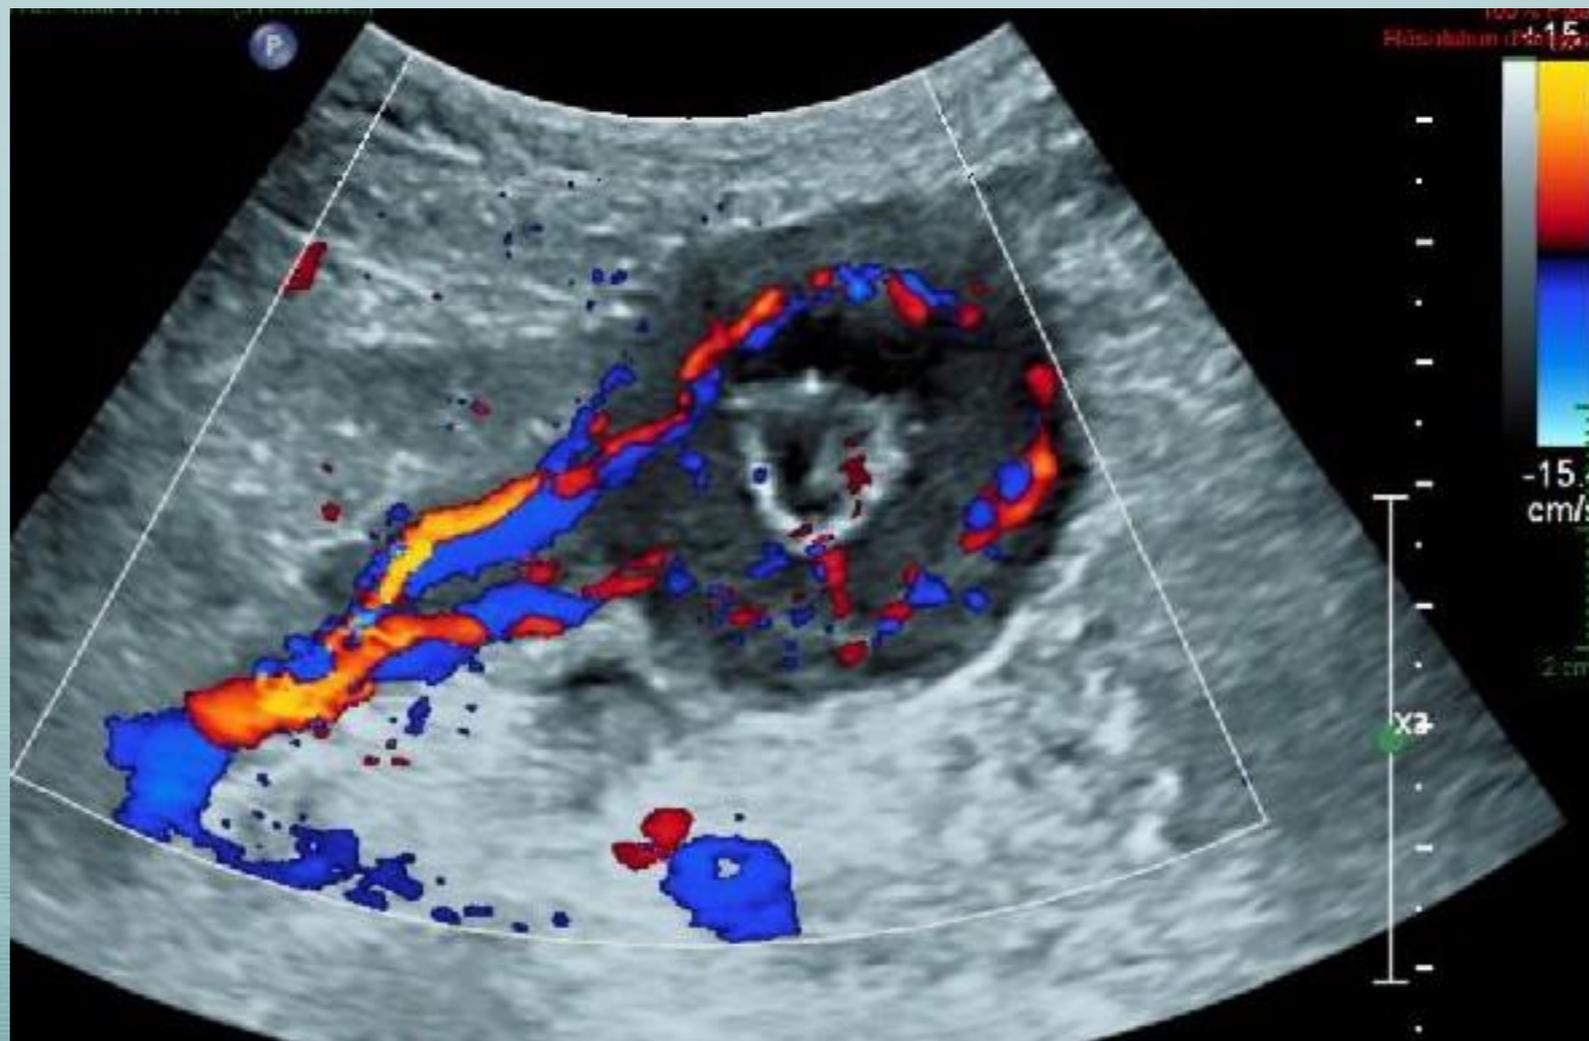

Iléite ischémique

topographie Extension	couches atteintes	épaississement	stratification	Doppler couleur	signes associés
étendue > 30 cm continue	sous muqueuse Transmurale	9mm	dédifférenciée dans formes graves	-	Ascite

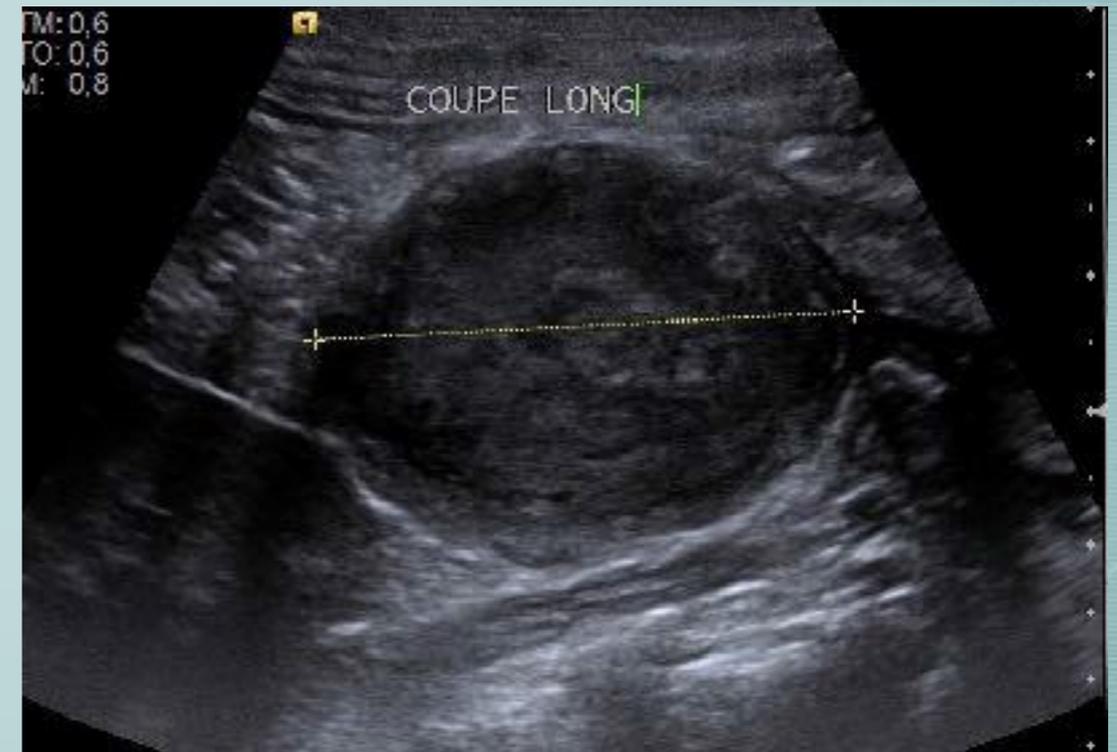

Entérite néoplasique

topographie Extension	couches atteintes	épaississement	stratification	Doppler couleur	signes associés
Focalisée < 10 cm	Toutes asymétrique	+++ > 3 cm	dédifférenciée	+	Ascite GG

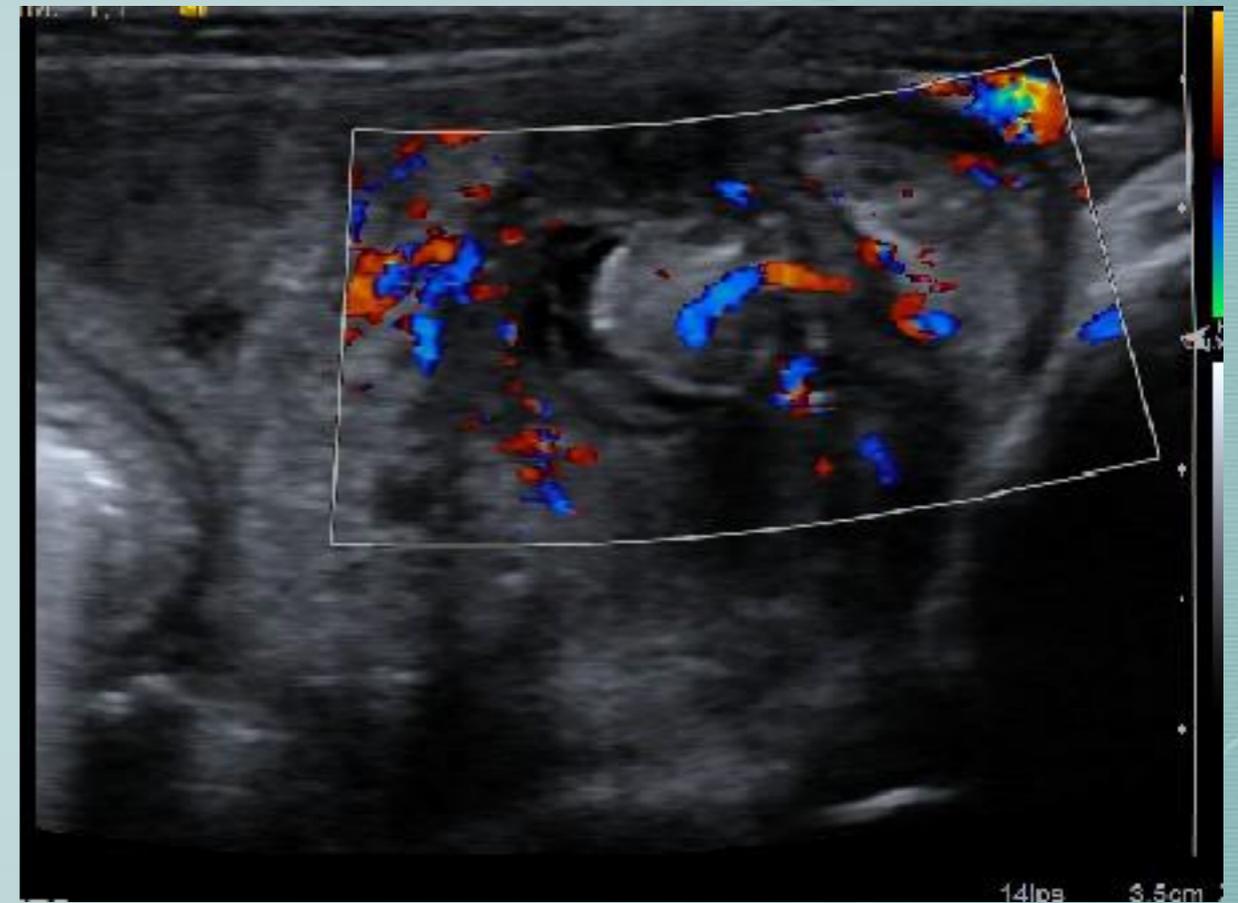

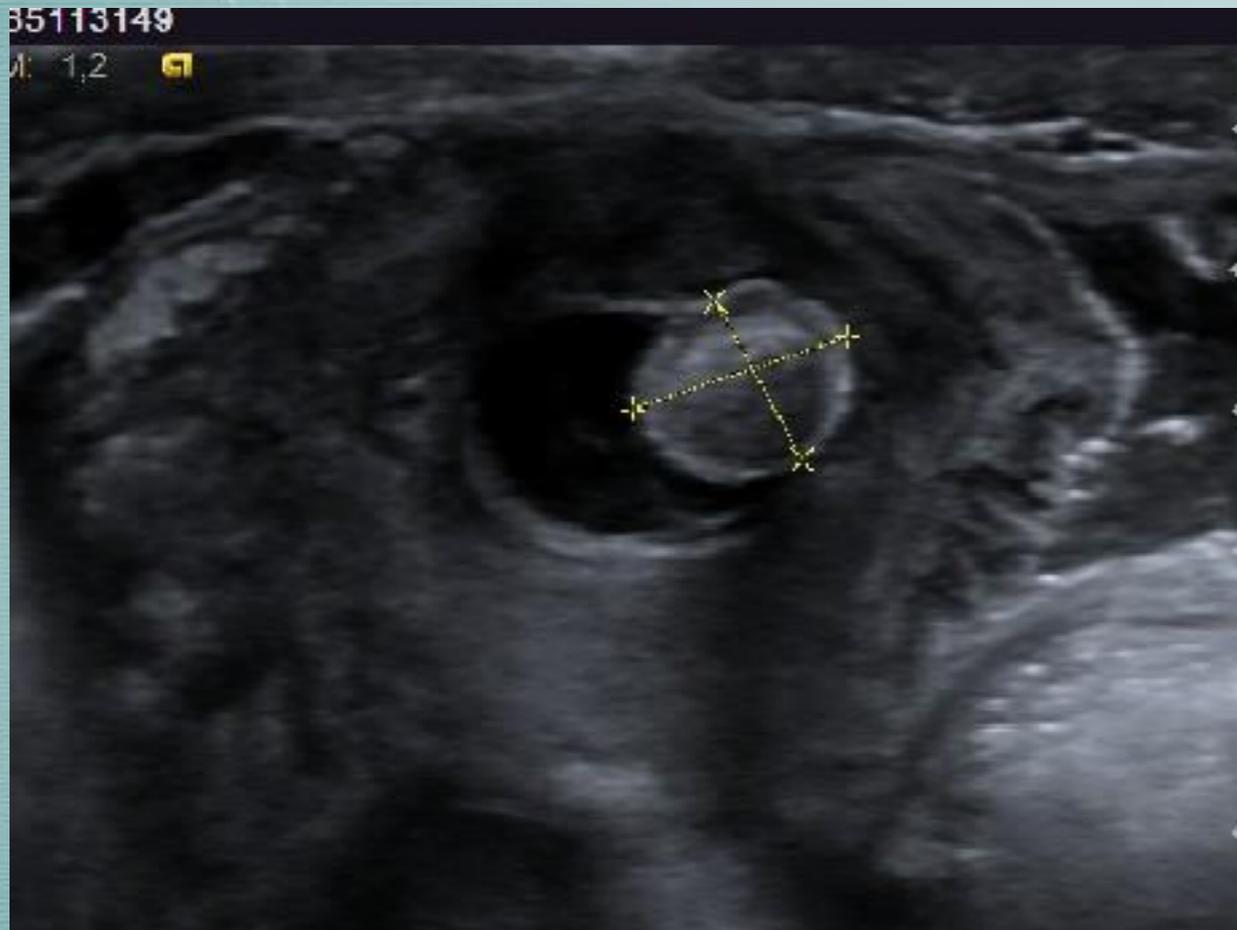

ILÉITE Néoplasique (au décours d'une invagination)

Lymphome du grêle

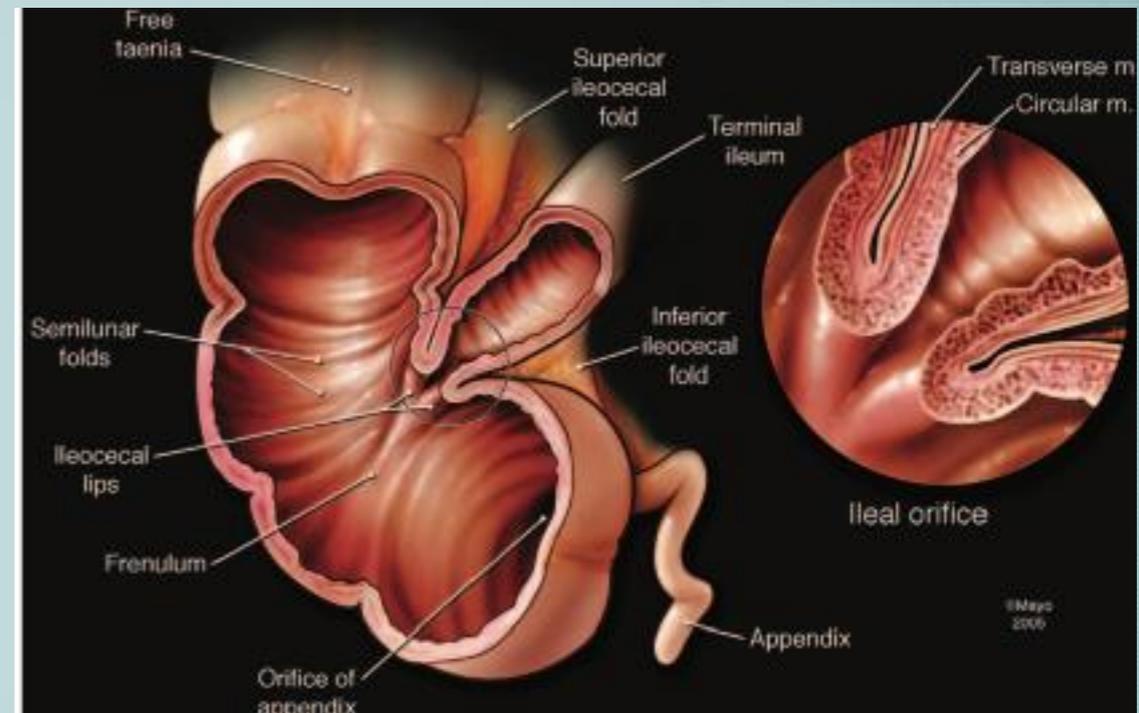

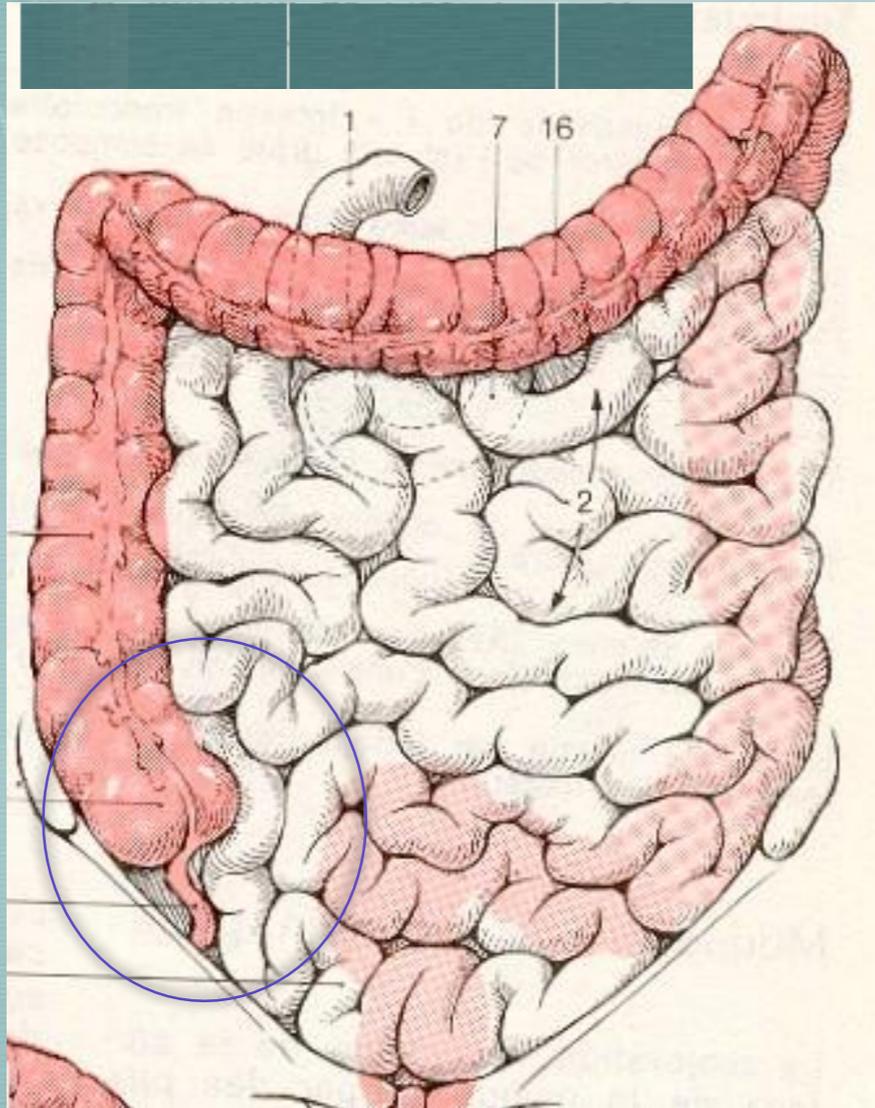

Grêle

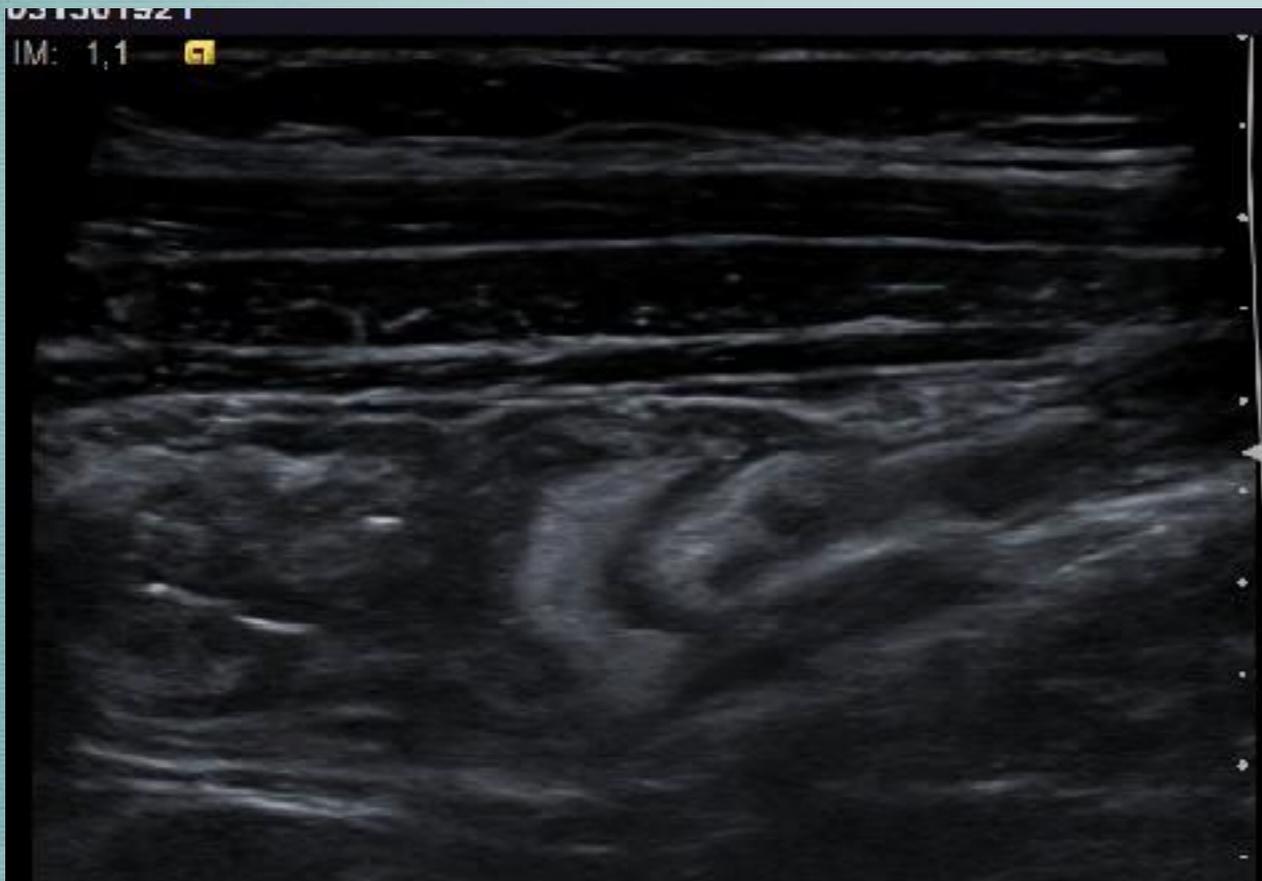

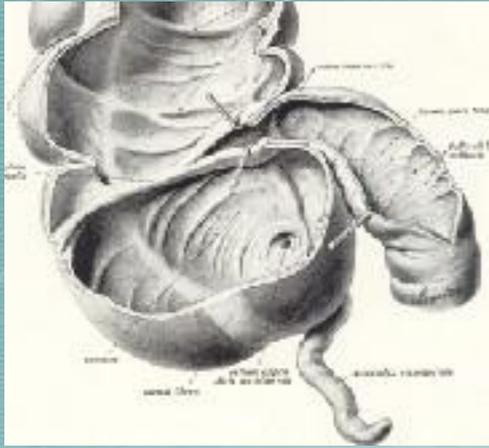

Polype adénomateux juvénile

CARREFOUR ILEO CAECAL

CARREFOUR ILEO CAECAL

Caecum /Valvule de Bauhin/ iléon

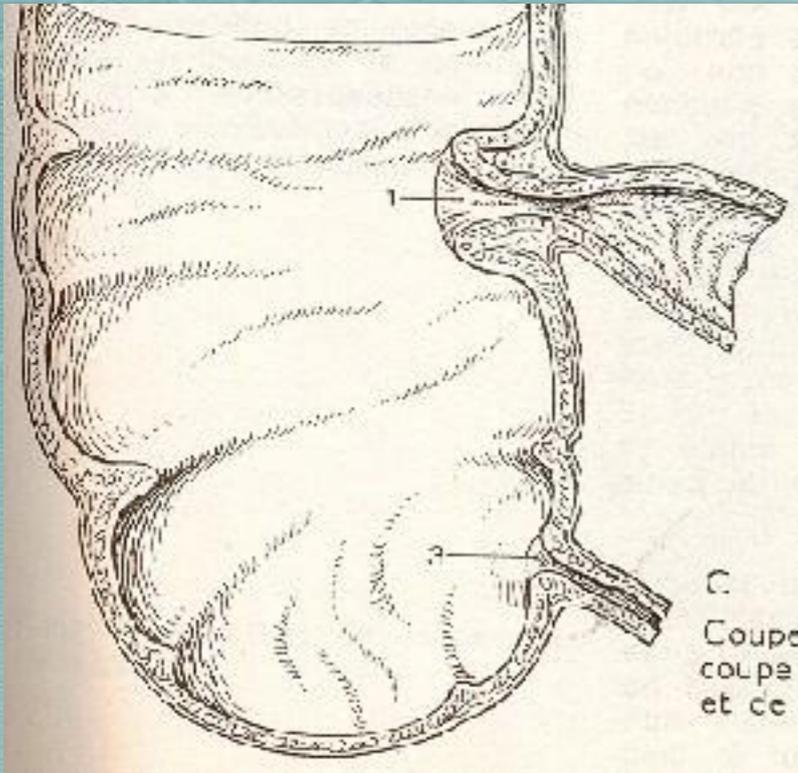

CARREFOUR ILEO CAECAL

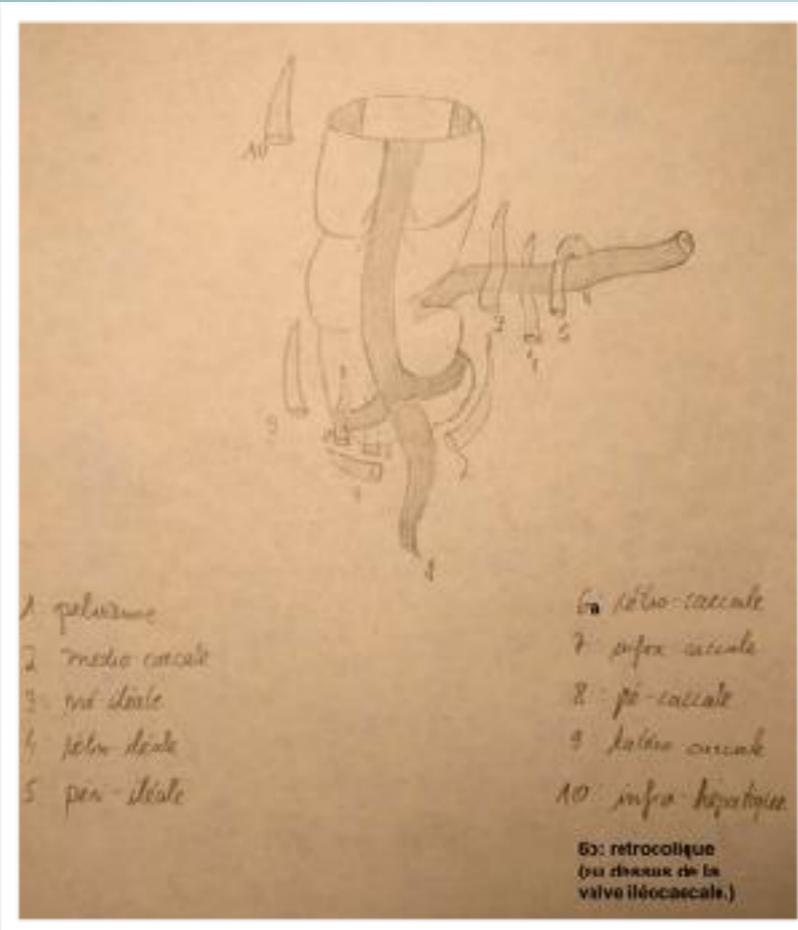

Valvule de Bauhin : museau de tanche ...

CARREFOUR ILEO CAECAL

Abouchement
iléon

Abouchement
appendice

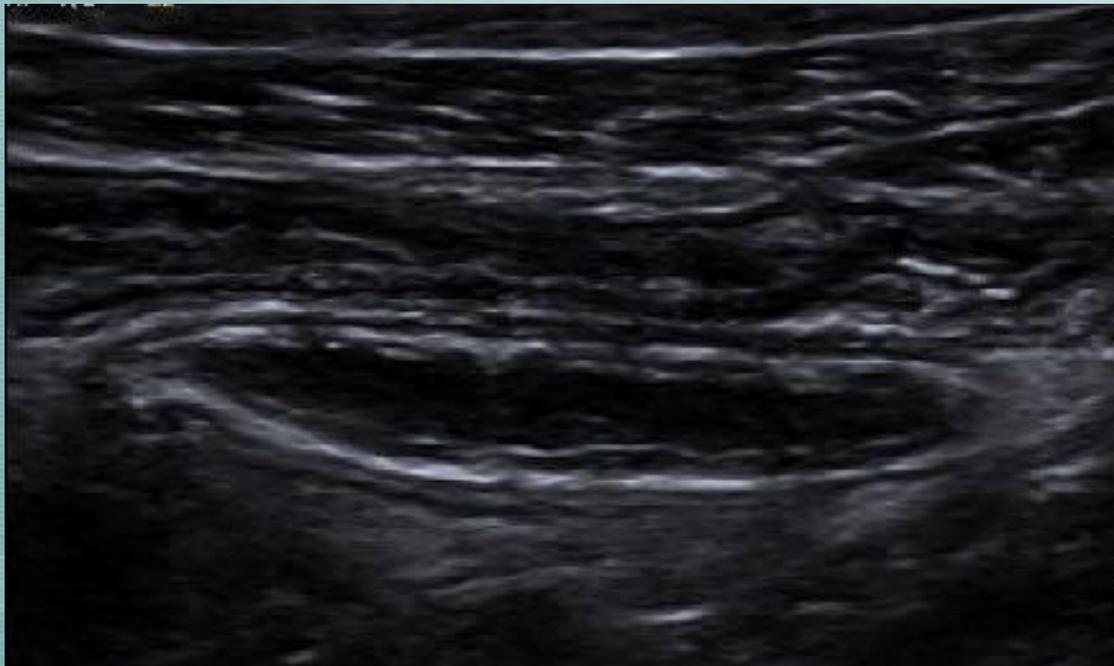

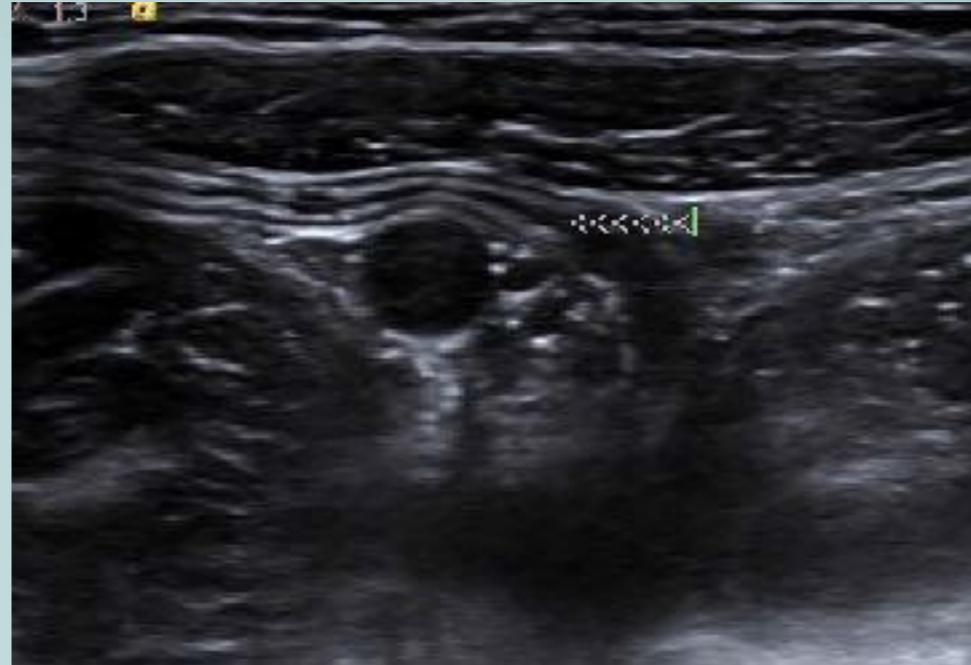

CARREFOUR ILEO CAECAL

APPENDICE ILEO CAECAL

appendice normal
borgne
diamètre < 6 mm
paroi fine

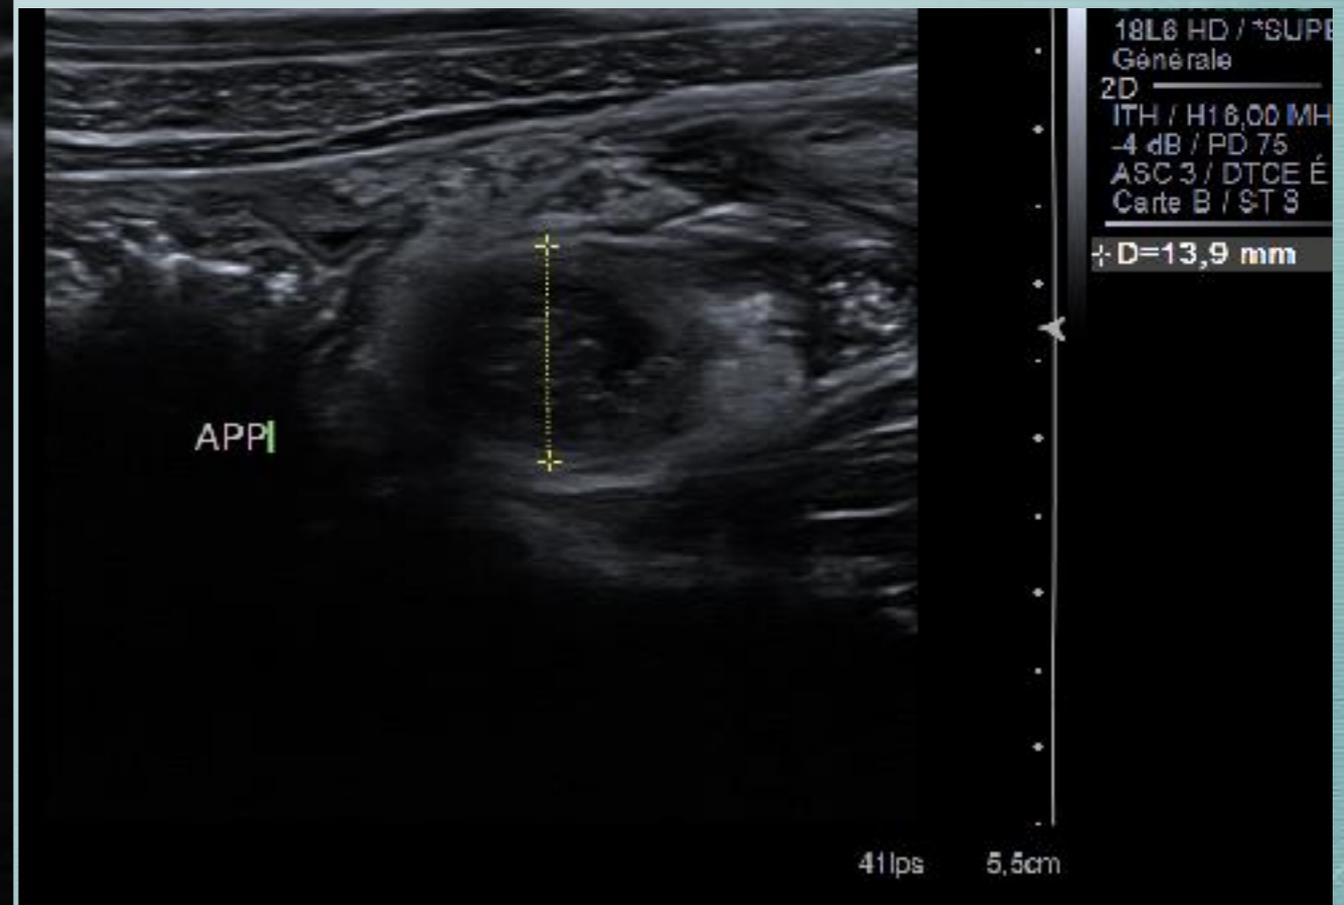

compressible
contenu parfois liquidien ,
stercolithe

Appendicite

épaississement pariétal
augmentation de calibre ≥ 6 mm
incompressible
infiltration de la graisse

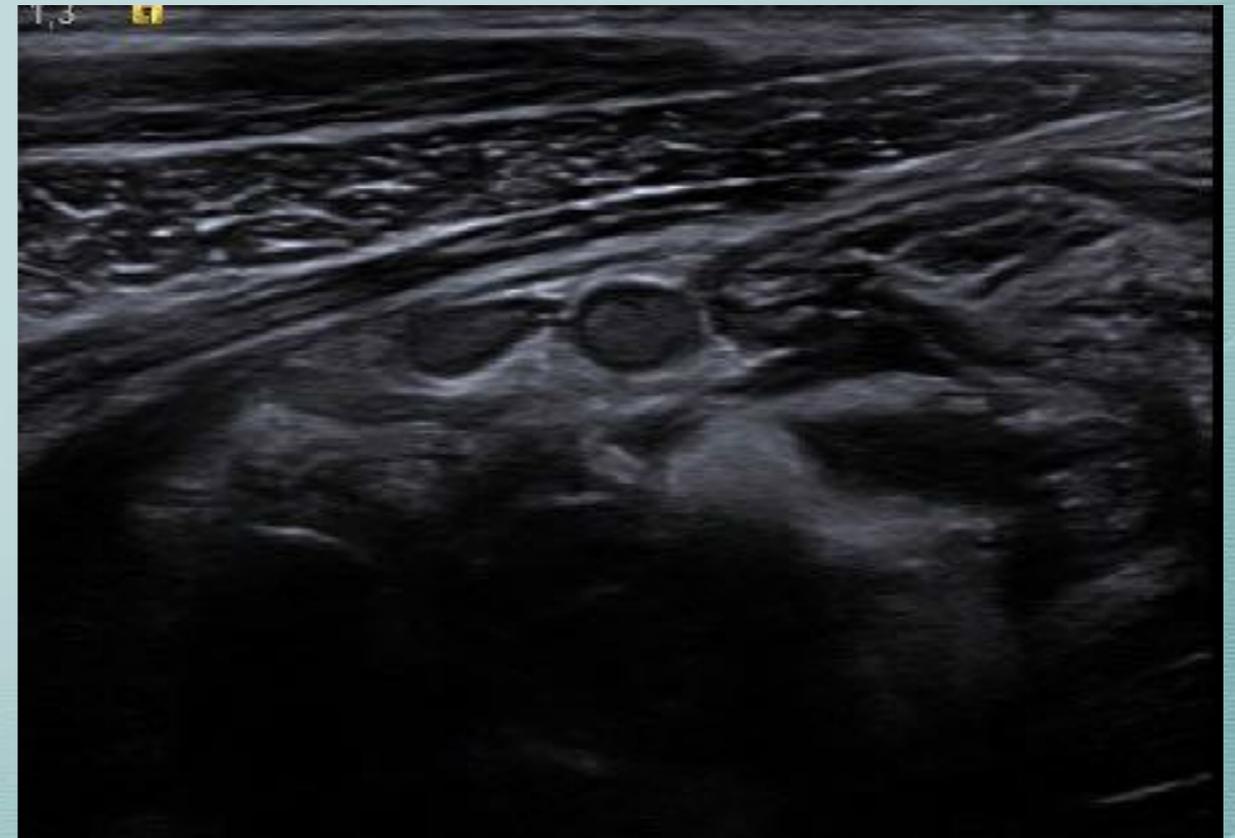

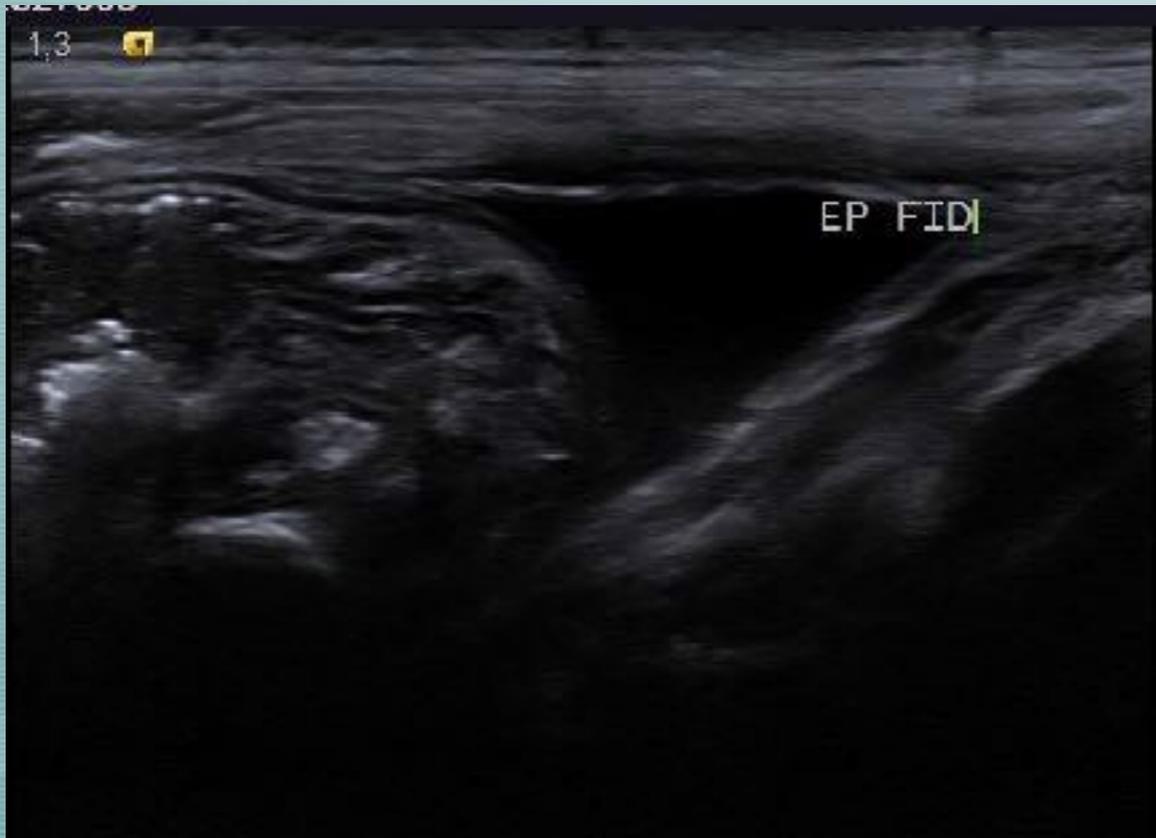

épanchement
adénopathies satellites

Appendicite

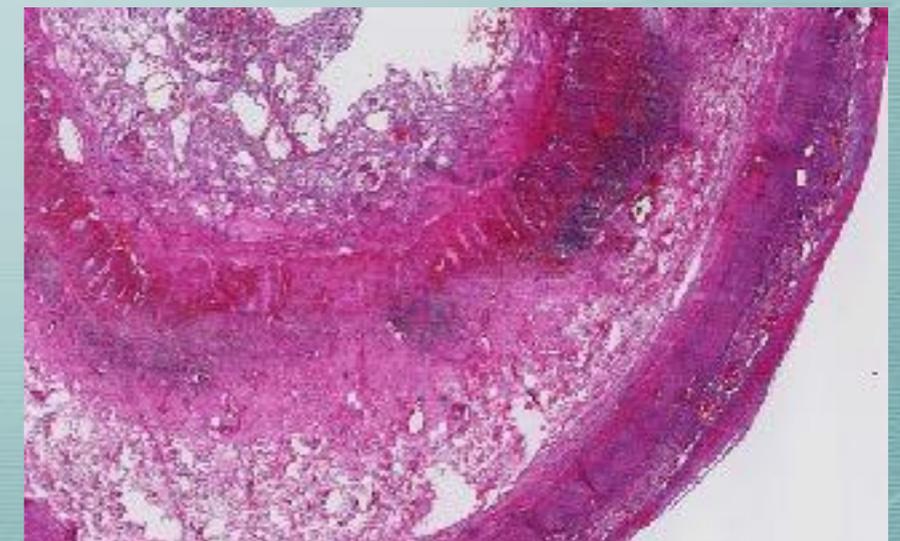

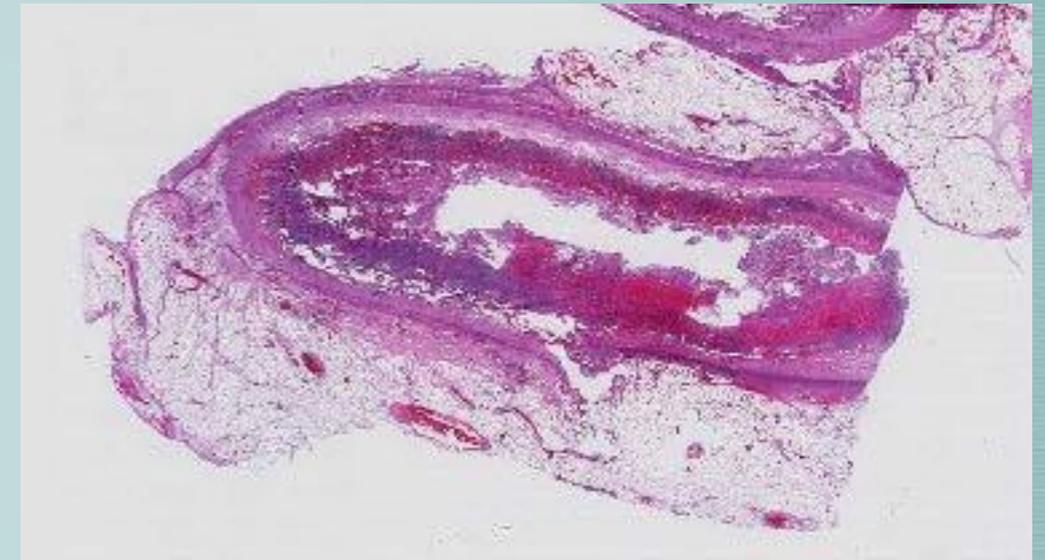

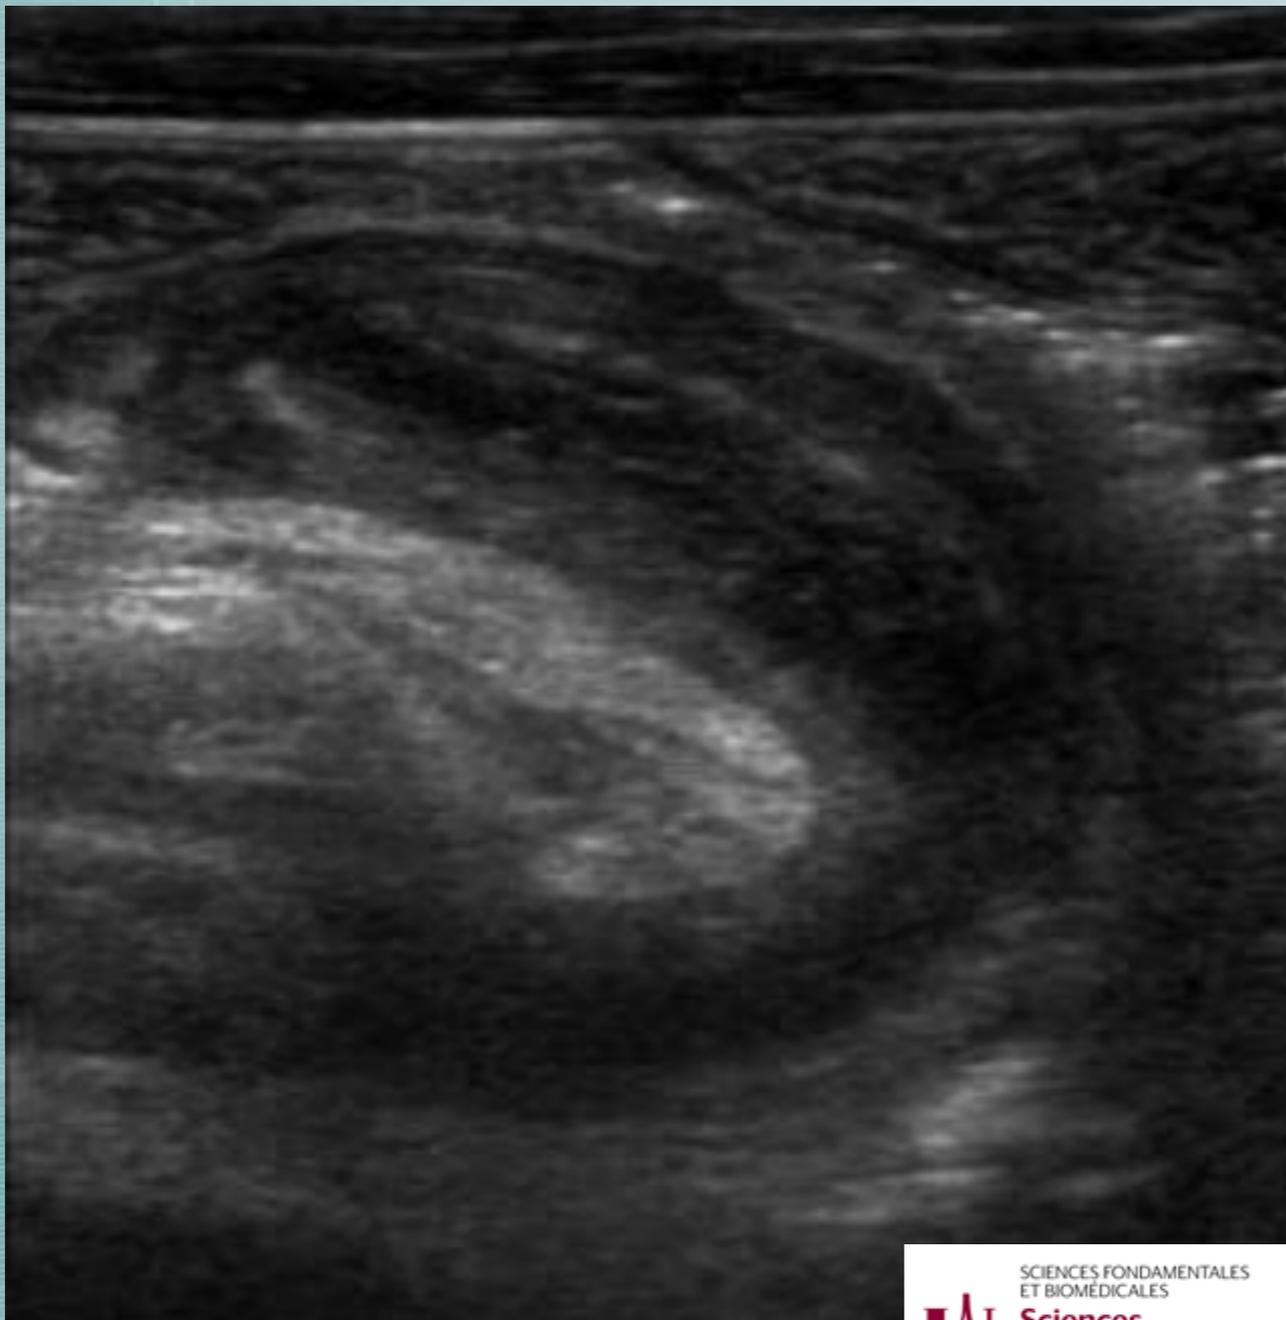

épaississement pariétal
augmentation de calibre $\geq 6\text{mm}$
incompressible
infiltration de la graisse

épanchement
adénopathies satellites

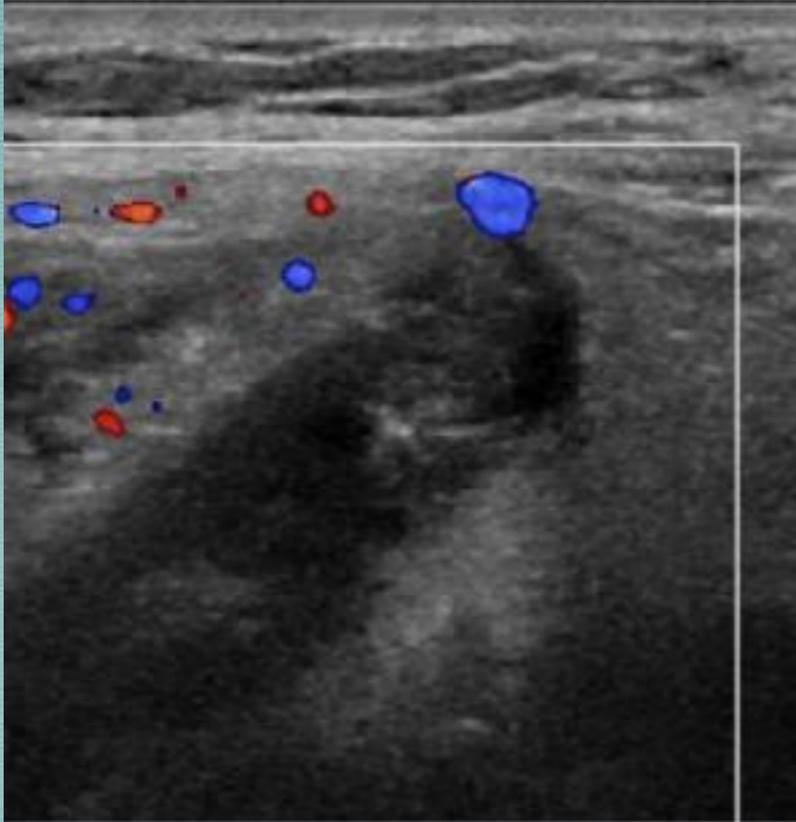

Appendicite aiguë

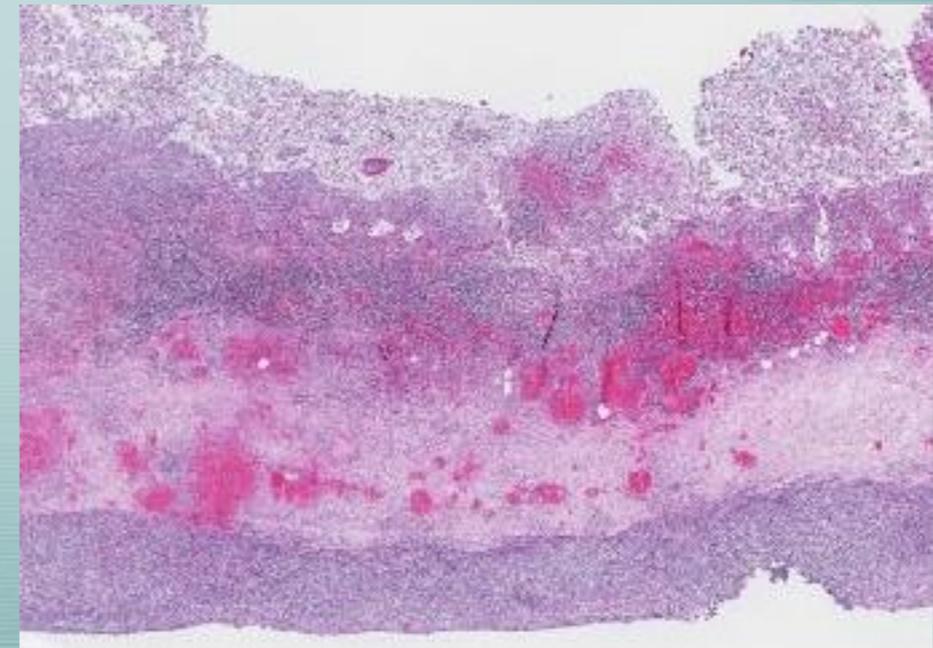

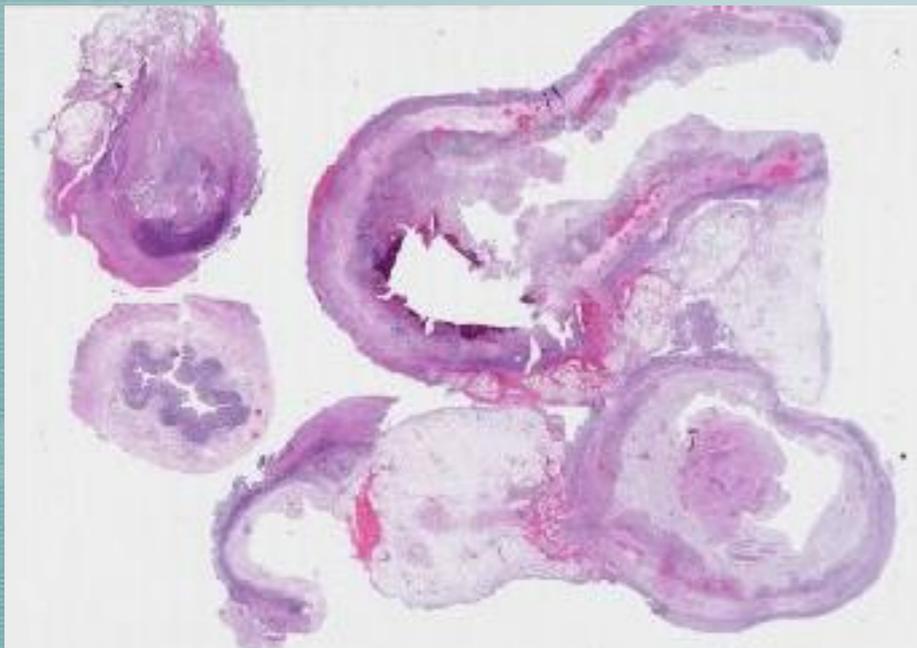

correspondance entre l'aspect échographique et l'histologie.

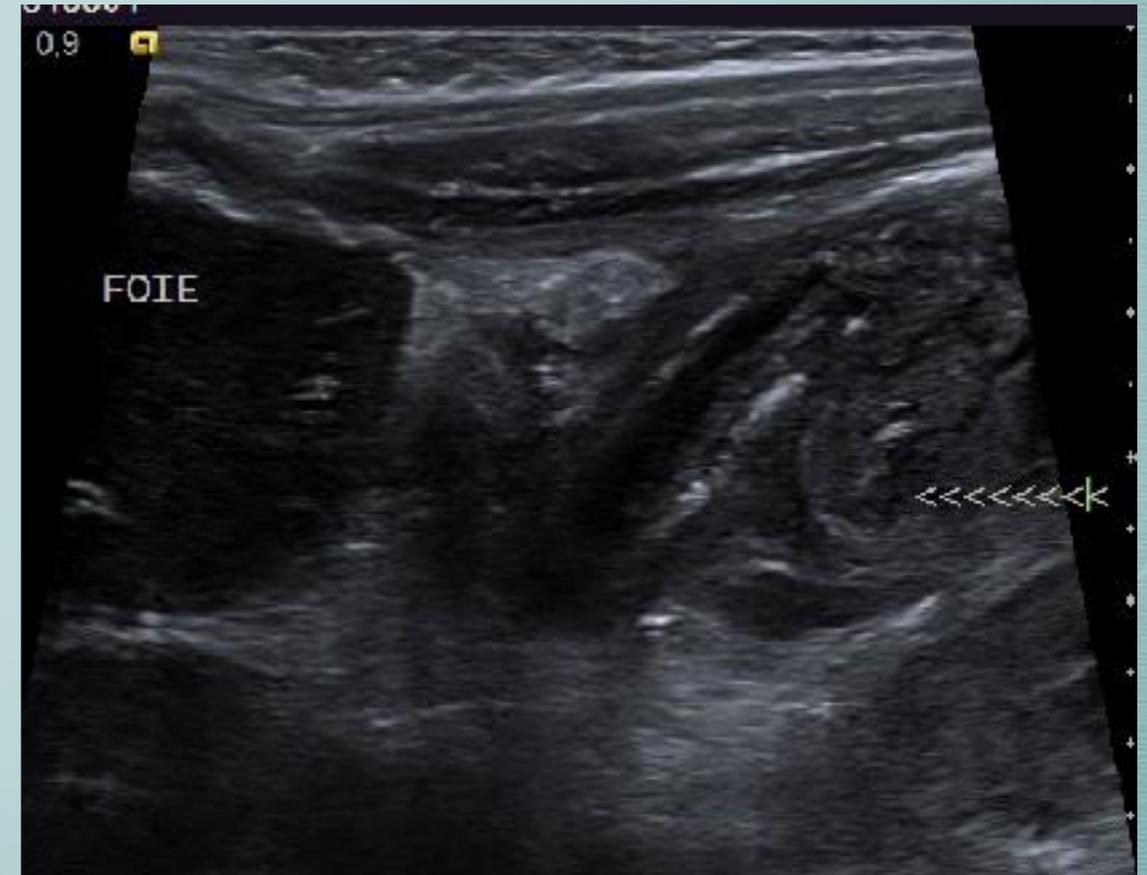

appendicite nécrotique

Perte des strates ,
aspect nécrotique

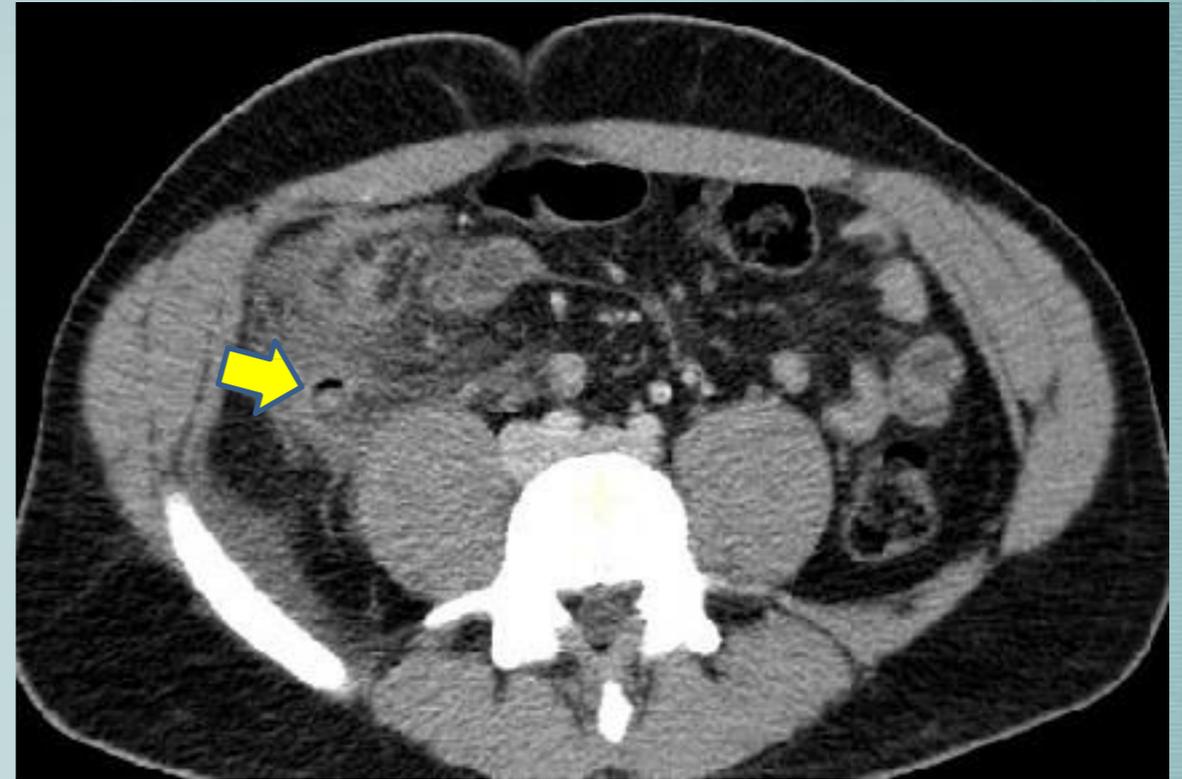

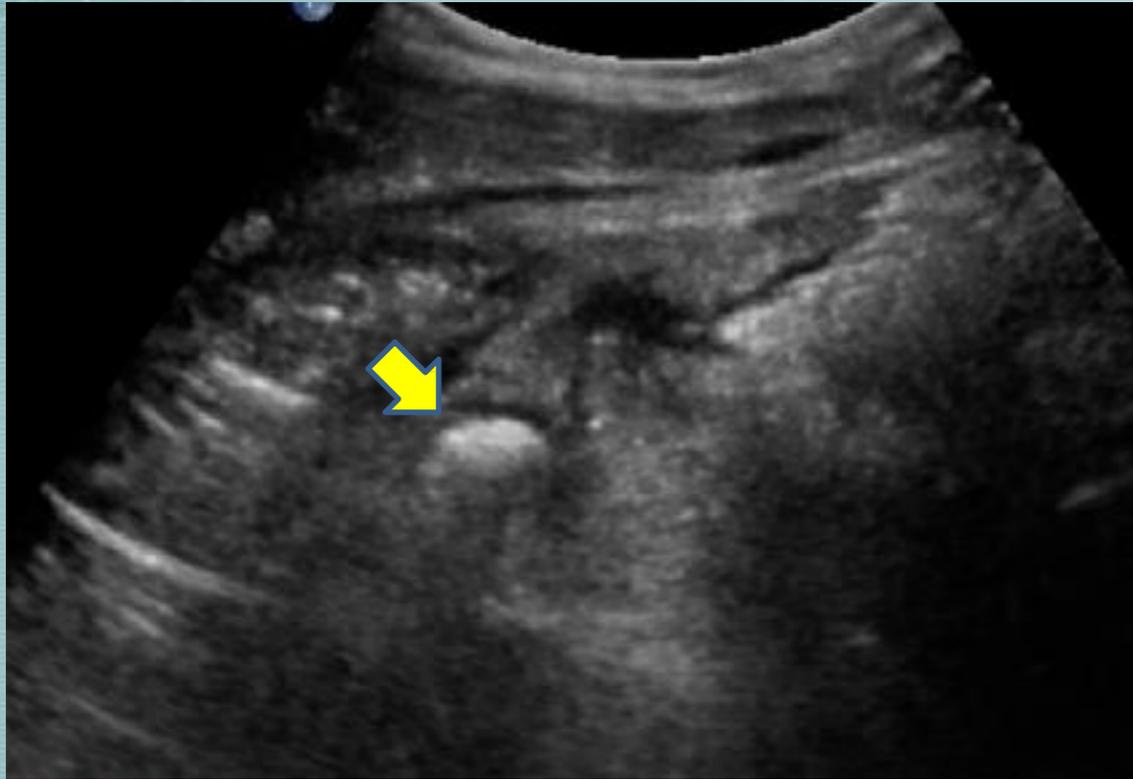

appendicite rétro caecale

Appendicite ou Adénolymphites ?

appendicite

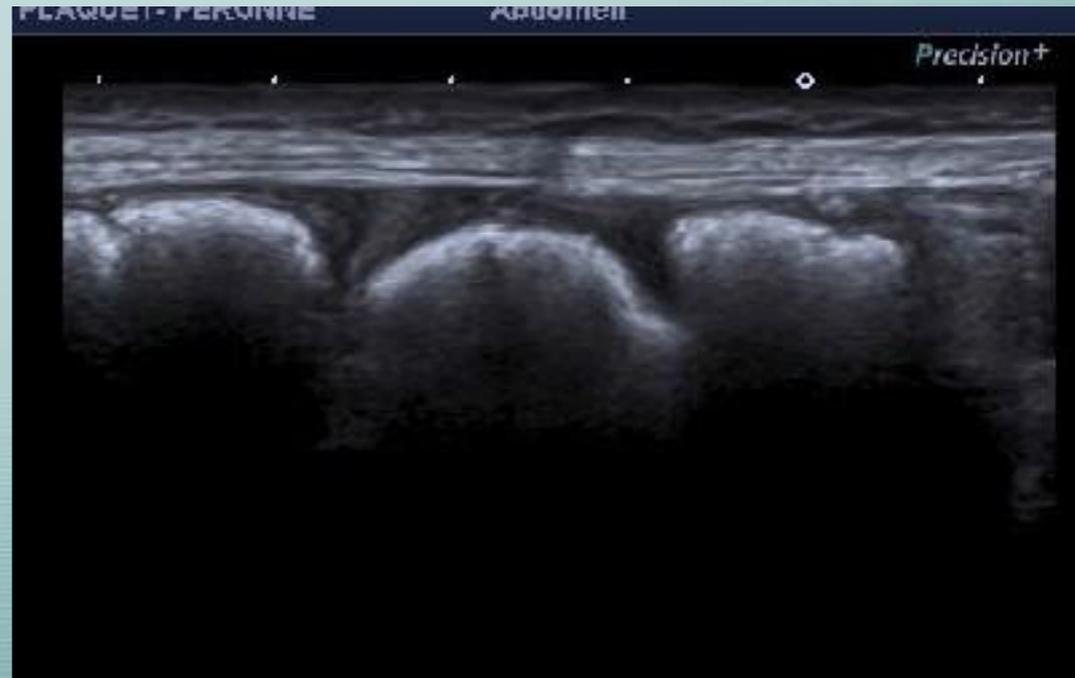

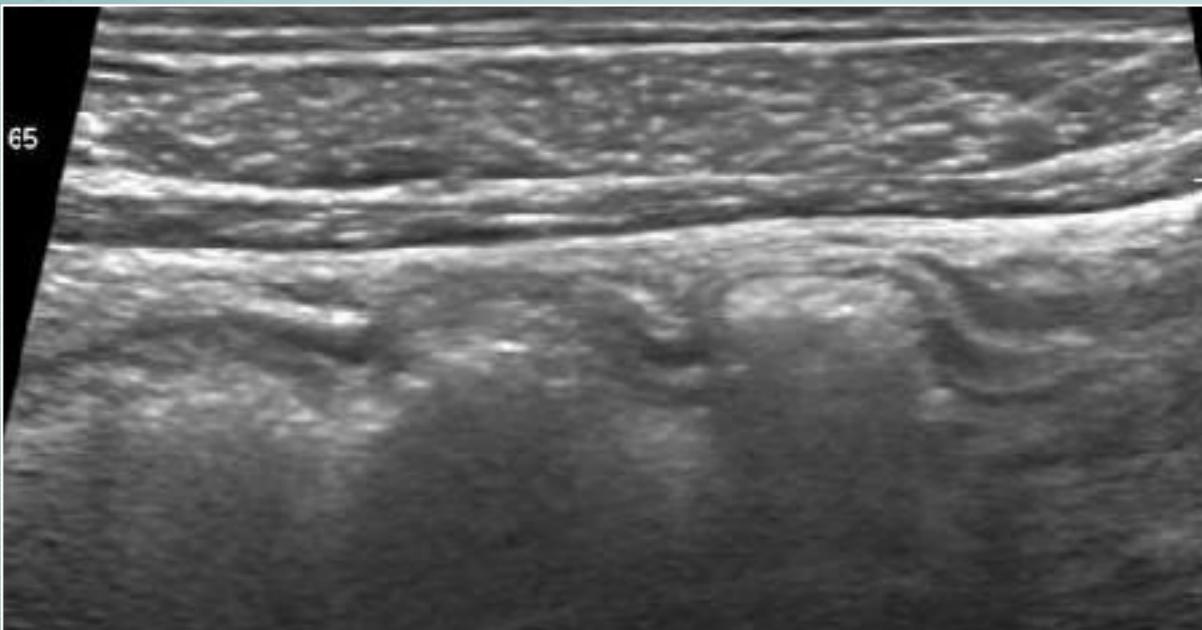

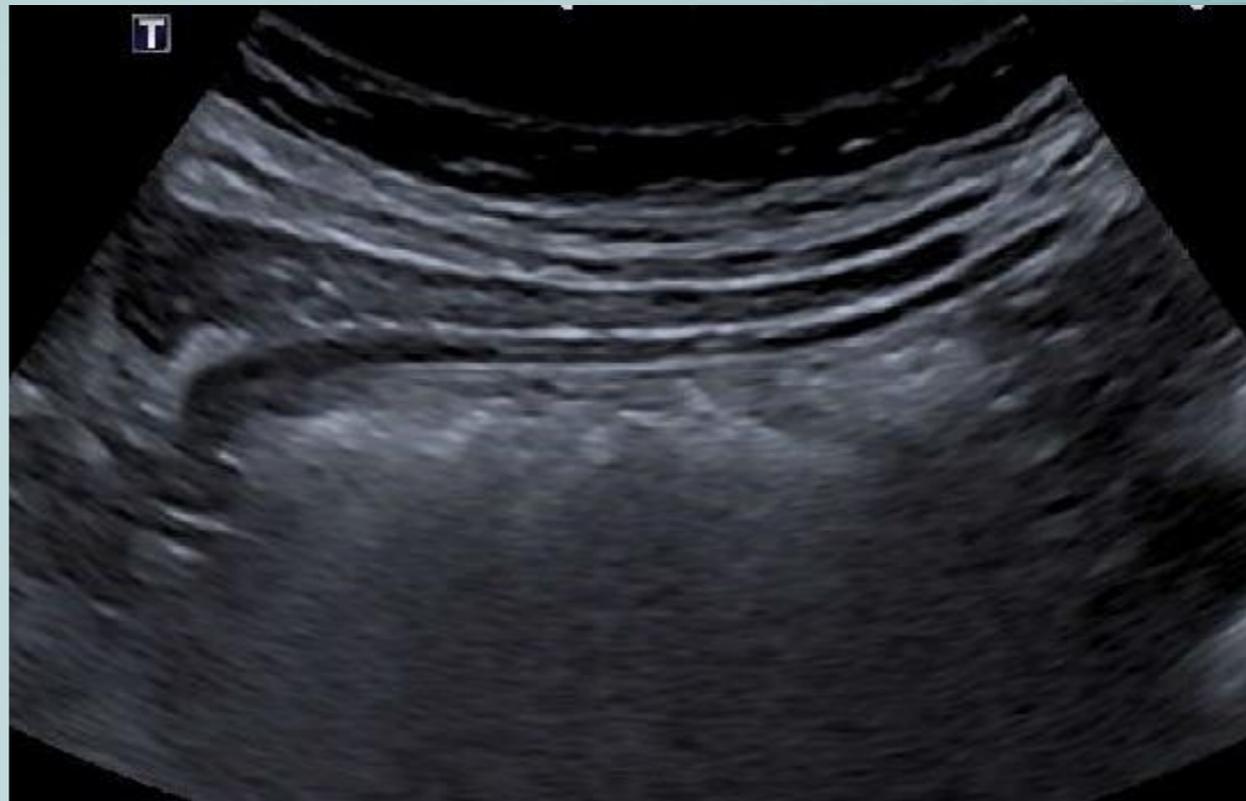

Appendicite difficile en US : on ne voit pas l'appendice avec certitude (peut-être en regard de la flèche) mais on identifie clairement la graisse péridigestive infiltrée.
Au CT, on retrouve un segment appendiculaire (flèche) et une importante infiltration de la graisse péricaecale .

Colon

Epaisseur < 5mm
